Note S1.

Preparation of 9-amino-10-cyanoanthracene (ACAN)

The compound, 9-amino-10-cyanoanthracene (ACAN) was prepared by the same procedure as outlined in a previous publication.¹ Briefly, the starting material, 9-nitroanthracene, was treated with three equivalents of sodium cyanide in dry DMF (under nitrogen) at room temperature. After 18 hours the solution was filtered and diluted with brine. The organic material was extracted from the solution, with CH_2Cl_2 , followed by acidification of CH_2Cl_2 with dilute hydrochloric acid. The precipitated solid was treated with 5% sodium bicarbonate to yield the desired compound, ACAN.

Purification of ACAN

The crude material was recrystallized from toluene, twice. NMR analysis of this sample gave excellent agreement with the published results. For the present spectroscopic studies, the material was further purified by HPLC. The preparative HPLC was done with a Waters HPLC system with semi-preparative reverse phase column [MetaChem, Intersil 5 μ ODS-3]. The monitoring system for the HPLC set-up was a diode array detector and the wavelength of this was set to 450 nm. The mobile phase used was a gradient with acetonitrile–water (with 0.1% TFA) and the fraction emerging at 19-20 minutes was collected and lyophilized. A small portion of the

lyophilized material was redissolved in acetonitrile and injected again in the HPLC (to ascertain the purity of the material). The HPLC trace thus obtained is shown below.

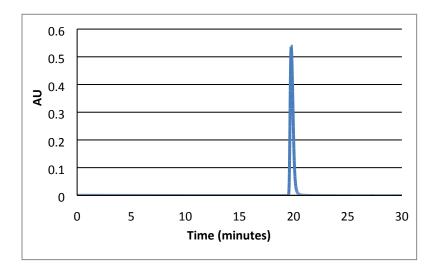

Figure S1. HPLC trace of the purified ACAN sample.

Note S2.

Stability of ACAN in highly acidic solutions

For the prototropic studies of ACAN, the absorption and fluorescence spectra have been recorded at very high H₂SO₄ concentrations. It is thus imperative to ascertain that there is no degradation of ACAN under these extreme conditions. Our concern was the stability of the cyano group of ACAN under strong acidic conditions. To allay our concern, we undertook a stability test of ACAN in the following manner: ACAN (10 mg) was dissolved in 2 mL DMSO-H₂O mixture (1:1 v/v). The solution was kept in ice/water bath, and 1 mL con. H₂SO₄ was added in small portions over 15 minutes. The mixture was stirred for 24 hours at room temperature (kept under argon and devoid of light) after which the acid was neutralized by the addition of solid NaHCO₃. This was followed by the addition of 10 mL of water, and the mixture was extracted with ethyl acetate (20 mL x 4 times). The extract was first dried with sodium sulfate, and then the organic solvent was evaporated to dryness under vacuum. Following this procedure, 7.8 mg of material was recovered. This material was then characterized using NMR analysis. The sample was dissolved in DMSO-d₆ and the ¹³C NMR was recorded on a Varian 400 MHz NMR instrument with the DMSO-d₆ line at 39.51 ppm being used as reference. The ¹³C NMR spectra thus obtained are shown below (Fig. S2A for the full and Fig. S2B for the expanded versions).

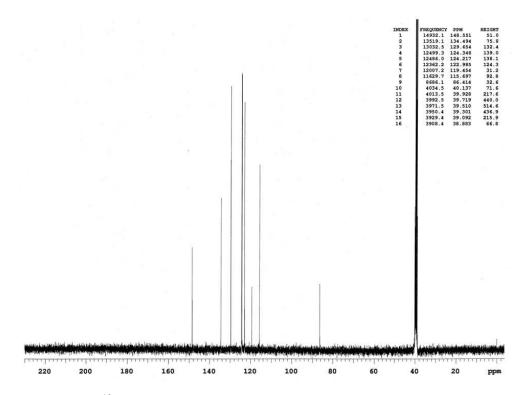

Figure S2A. ¹³C NMR of ACAN sample after the treatment with acid (discussed above).

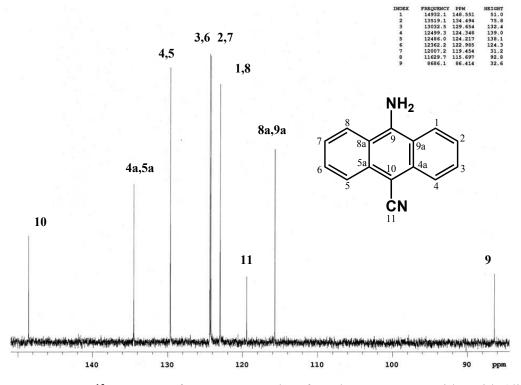

Figure S2B. ¹³C NMR of ACAN sample after the treatment with acid (discussed above)-expanded from Fig. S2A.

The relevant ¹³C line listings are as follows (in ppm): 148.551, 134.494, 129.654, 124.348, 124.217, 122.985, 119.454, 115.697, 86.414.

The ¹³C line at 115.697 ppm is assigned to the cyano group, similar to benzonitrile.² There was no change in the ¹³C NMR of the material before (Fig. S2C, Fig. S2D) and after the treatment with acid (i.e., no additional peaks appeared in the ¹³C NMR of the recovered material, after the acid treatment). Thus, we are sure that the cyano group of ACAN is stable in the absorption/fluorescence experiments carried out at highly acidic conditions.

^aThe fluorescence decays were fitted by considering a bi-exponential function;

$$I(t) = a_1 \exp(-t / \tau_1) + a_2 \exp(-t / \tau_2) \quad ; \quad A_1(\%) = \frac{a_1 \tau_1}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2} \times 100 \text{ and } \quad A_2(\%) = \frac{a_2 \tau_2}{a_1 \tau_1 + a_2 \tau_2$$

(A) Absorption spectra and (B) emission spectra (excitation wavelength = 435 nm) of ACAN in Cyclohexane-Ethylacetate (CH-EA) solvent mixtures; (1) CH_{100} -EA₀, (2) $CH_{99.5}$ -EA_{0.5}, (3) CH_{98} -EA₂, (4) CH_{90} -EA₁₀, (5) CH_0 -EA₁₀₀. The subscripts show the volume percentage of each solvent.

Note S3

Exchange of amino hydrogen atoms of ACAN with deuterium

We have carried out photophysical experiments in H₂O and D₂O. It is postulated that the -NH₂ group of ACAN gets converted to $-ND_2$ in D₂O solution. The support for this assertion comes from the NMR analysis of ACAN in CDCl₃, with and without the addition of D₂O. The compound was dissolved in CDCl₃ and the ¹H NMR was recorded on a Varian 400 MHz NMR instrument (with TMS as an internal reference, at 0.0 ppm). The ¹H NMR spectra are shown below (Fig. S6A and S6B, full & expanded versions, respectively). The broad peak appearing at 5.54 ppm is assigned to the $-NH_2$ hydrogen atoms. On shaking the NMR sample with 2 drops of D₂O, the peak at 5.54 ppm disappears and a new peak at 4.77 ppm (corresponding to D-O-H) appears (Fig. S6C and S6D).

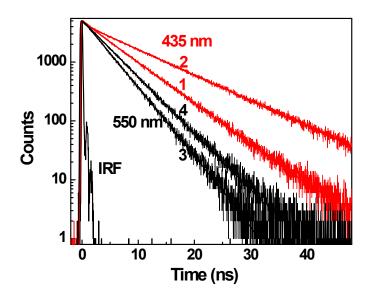

Figure S8. Fluorescence decay traces of ACAN at 435 nm (red lines) before (1) and after (2) purging with N_2 . Fluorescence decay traces of ACAN at 550 nm (black lines) before (3) and after (4) purging with N_2 .

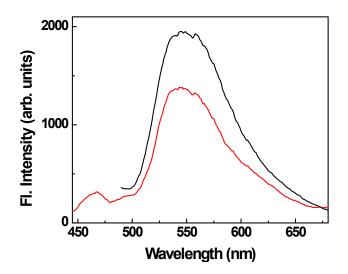

Figure S9. Emission spectra from ACAN film deposited on quartz slide on excitation at (1) 350 nm and (2) 435 nm.

Note S4.

A thin film of ACAN was obtained by depositing drops of acetonitrile solution of ACAN on a clean quartz slide and allowing the solvent to dry off slowly at ambient conditions. The fluorescence spectra were recorded with front face geometry using suitable emission filters to minimize the scattered light.

<u>Note S5.</u>

To determine the pK_a value of ACANH⁺ we recorded the absorption spectra of ACAN in aqueous medium (5% methanol in water) with gradually increasing H₂SO₄ concentrations. These spectra were used to construct a plot of the optical density (OD, at 465 nm) versus the Hammett acidity function, H₀ (inset in Fig. 8). According to the Henderson-Hasselbalch equation,

$$pH = pK_a + \log \frac{[ACAN]}{[ACANH^+]}$$
(1)

Since the acid concentrations in the present cases are very high, we used the Hammett acidity function, H_0 , instead of the pH scale. From the above plot of OD vs. H_0 , the inflection point where [ACAN]/[ACANH⁺] =1, is obtained at $H_0 = -1.3$. This H_0 value at the inflection point was

further adjusted for proton activity based on the data reported by Dixon et al.⁴ The proton activity corrected pK_a for ACANH⁺ was thus estimated to be -0.9.^{3,4}

The excited state acidity constant, pK_a^* , was estimated using the Förster cycle method, which correlates the ground- and excited-state acidity constants (i.e. pK_a and pK_a^* , respectively) as,

$$pK_a^* = pK_a + \frac{hc\Delta v}{2.303RT}$$
(2)

where, $\Delta \overline{v} = \overline{v}_{ACAN} - \overline{v}_{ACANH^+}$, \overline{v}_{ACAN} and \overline{v}_{ACANH^+} being the 0-0 absorptions of the base (ACAN) and conjugate acid (ACANH⁺) forms, respectively.⁵ The energy of the 0-0 transition was determined from the intersection point of the excitation and emission spectra of the corresponding forms.
