## Content

Part 1. Definitions of binding, interaction and preparation energies
Part 2. Details of EDA for newly formed U-C bonds in I and $\mathbf{V}$
Part 3. Details of MOs information for configuration I
Part 4. MOs information for configuration $\mathbf{V}$
Part 5. References for Supplementary Information

## Part 1. Definitions of binding, interaction and preparation energies

The calculated binding $\left(E_{\text {bin }}\right)$, interaction $\left(E_{\text {int }}\right)$ and preparation ( $E_{\text {prep }}$ ) energies are defined as

$$
\begin{align*}
& E_{\text {bin } / \text { int }}=\left[E_{\text {iso/relaxed }}\left(\mathrm{UC}_{2}\right)+E_{\text {iso/relaxed }}(\mathrm{V} 6)\right]-E\left(\mathrm{UC}_{2}+\mathrm{V} 6\right)  \tag{1}\\
& E_{\text {prep }}=E_{\text {int }}-E_{\text {bin }}=E_{\text {prep }}\left(\mathrm{UC}_{2}\right)+E_{\text {prep }}(\mathrm{V} 6)=\left[E_{\text {relaxed }}\left(\mathrm{UC}_{2}\right)-E_{\text {iso }}\left(\mathrm{UC}_{2}\right)\right]+\left[E_{\text {relaxed }}(\mathrm{V} 6)-E_{\text {iso }}(\mathrm{V} 6)\right] \tag{2}
\end{align*}
$$

where $E\left(\mathrm{UC}_{2}+\mathrm{V} 6\right)$ is the total energy of the $\mathrm{UC}_{2}$ molecule trapped in the graphene with V 6 defect, $E_{\text {iso }}\left(\mathrm{UC}_{2}\right)$ and $E_{\text {iso }}(\mathrm{V} 6)$ represent the total energies of the isolated $\mathrm{UC}_{2}$ and graphene with V6 defect, respectively, and $E_{\text {relaxed }}\left(\mathrm{UC}_{2}\right)$ or $E_{\text {relaxed }}(\mathrm{V} 6)$ denotes the total energy of $\mathrm{UC}_{2}$ or graphene with V 6 defect in its relaxed geometry, with both the $\mathrm{UC}_{2}$ and graphene being in the same atomic configurations as in the relaxed $\mathrm{UC}_{2}+\mathrm{V} 6$ system. The $E_{\text {int }}$ represents a measure of the strength of the chemical interaction between the $\mathrm{UC}_{2}$ molecule and V 6 -defective graphene, a positive $E_{\text {int }}$ means an attractive interaction; while the $E_{\text {bin }}$ encompasses not only the energy gained due to the chemical interaction $E_{\text {int }}$, but also the energy paid to deform the $\mathrm{UC}_{2}$ molecule and V6-defective graphene from their ideal configurations to the relaxed $\mathrm{UC}_{2}+\mathrm{V} 6$ system (i.e., preparation energy, $E_{\text {prep }}$ ). The terms "binding energy" ("adsorption energy") and "interaction energy" are often used ambiguously in the literature.

## Part 2. Details of EDA for newly formed U-C bonds in I and V.

Table S1. EDA parameters for newly formed U-C bonds in I and $\mathbf{V}$ (energy in eV ).

| Configuration | Fragment | $\Delta \boldsymbol{E}_{\text {int }}{ }^{\mathrm{a}}$ | $\Delta \boldsymbol{E}_{\text {Pauli }}{ }^{\mathrm{b}}$ | $\Delta \boldsymbol{E}_{\text {elestat }}{ }^{\mathrm{c}}$ | $\Delta \boldsymbol{E}_{\text {orb }}{ }^{\mathrm{d}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{I}$ | $\mathrm{U} / /(\mathrm{V} 6+\mathrm{C} 2)$ | 29.92 | -65.13 | $31.03(33 \%)$ | $64.01(67 \%)$ |
| $\mathbf{V}$ | $\mathrm{UC}_{2} / / \mathrm{V} 6$ | 14.86 | -23.31 | $11.90(31 \%)$ | $26.27(69 \%)$ |

${ }^{\text {a }}$ Interaction energy, $\Delta \boldsymbol{E}_{\text {int }}=\Delta \boldsymbol{E}_{\text {Pauli }}+\Delta \boldsymbol{E}_{\text {elestat }}+\Delta \boldsymbol{E}_{\text {orb }}$; ${ }^{\text {b }}$ Pauli repulsion energy; ${ }^{\text {c }}$ Electrostatic interaction energy; ${ }^{\text {d }}$ Orbital interaction energy. (To be consistent with equations (1) and (2), we have taken positive sign for attractive interaction, which is opposite to the results of bond energy decomposition implemented in ADF.)

One might notice that different interaction energy values are presented in Table S 1 and Table 1 for configuration $\mathbf{V}$, despite the same method in dividing fragments. This originates from different calculation methods for $E_{\text {int }}$ and $\Delta E_{\text {int }}$. According to the equation (2), $E_{\text {int }}$ is calculated by

$$
\begin{equation*}
E_{\text {int }}=E_{\text {bin }}+E_{\text {prep }}=E_{\text {bin }}+E_{\text {prep,geo }} \tag{3}
\end{equation*}
$$

However, based on the energy decomposition method in ADF, $\Delta E_{\text {int }}$ is calculated by

$$
\begin{equation*}
\Delta E_{\text {int }}=E_{\text {bin }}+E_{\text {prep }}=E_{\text {bin }}+E_{\text {prep,geo }}+E_{\text {prep,el }} \tag{4}
\end{equation*}
$$

where $E_{\text {prep,geo }}$ is the energy required to deform the separated fragments from their equilibrium geometry to the geometry in the compound, and $E_{\text {prep,el }}$ refers to the energy necessary to electronically excite the fragments from their electronic ground-states to their valence electronic configuration. Therefore, the origination of difference between $E_{\text {int }}$ and $\Delta E_{\text {int }}$ can be derived from

$$
\begin{equation*}
\Delta E_{\mathrm{int}}-E_{\mathrm{int}}=E_{\mathrm{prep}, \mathrm{el}} \tag{5}
\end{equation*}
$$

$E_{\text {prep,el }}$ has been taken into account in bond energy decomposition in ADF, but is not included in equation (3).

## Part 3. Details of MOs information for configuration I

Table S2. Main contributions from AOs ( $\geq 1 \%$ ) to the MOs with uranium participation for configuration $\mathbf{I}$, and contributions from MOs to selective U-C bonds*.

| MOs | Orbital Energy (eV) | Contributions to bond (\%) |  | U (\%) |  |  |  | $\mathrm{C}\left(\mathrm{UC}_{2}\right)(\%)$ |  | C1(V6) (\%) |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathbf{U - C}\left(\mathbf{U C}_{2}\right)$ | U-C1(V6) | $\mathbf{5 f}$ | 6d | 6p | other | 2 s | 2p | 2s | 2p |
| HOMO | 0.00 |  |  | 3 |  |  |  |  |  |  |  |
| HOMO-1 | -0.02 |  | 4 | 6 | 2 |  |  |  |  |  | 2 |
| HOMO-2 | -0.41 | 12 |  | 15 | 3 |  |  |  | 6 |  |  |
| HOMO-3 | -0.59 | 8 |  | 10 | 2 |  |  |  | 5 |  |  |
| HOMO-4 | -0.71 | 3 |  | 4 |  |  |  |  | 3 |  |  |
| HOMO-5 | -0.96 |  |  | 4 |  |  |  |  |  |  |  |
| HOMO-6 | -1.06 | -1 | -2 | 25 | 4 | 3 | 7p: 1 | 1 | 7 | 1 | 5 |
| HOMO-7 | -1.08 |  |  | 2 |  |  |  |  |  |  |  |
| HOMO-8 | -1.29 |  | 7 | 4 | 2 |  |  |  |  |  | 8 |
| HOMO-9 | -1.35 |  |  | 1 | 6 |  |  |  |  |  |  |
| HOMO-10 | -1.37 | 6 | 2 | 16 |  |  |  |  | 6 |  | 2 |
| HOMO-11 | -1.47 | 2 | 1 | 9 | 1 |  |  |  | 2 |  | 2 |
| HOMO-12 | -1.53 | 6 |  | 16 | 5 | 1 |  |  | 7 |  | 4 |
| HOMO-13 | -1.61 |  |  | 2 | 3 |  |  |  |  |  |  |
| HOMO-20 | -2.35 |  |  | 3 | 2 |  | 7s: 4 |  |  |  |  |
| HOMO-21 | -2.55 | 11 | 11 | 5 | 5 |  |  |  | 6 |  | 7 |
| HOMO-199 | -18.99 |  |  |  |  | 93 | 5p: 2 |  |  |  |  |
| HOMO-200 | -19.58 | 12 | 13 |  |  | 75 | 5p: 2 | 3 | 2 | 2 | 1 |
| HOMO-201 | -19.60 | 13 | 9 |  |  | 78 | 5p: 2 | 3 | 2 | 1 | 1 |

*Note: the contributions from MOs to U-C bonds are calculated from Mulliken bond order decomposition, ${ }^{[1-3]}$ the negative values indicate contributions to atibonding. Because of the approximate symmetry of $\mathbf{I}$, only information of one $\mathrm{U}-\mathrm{C}(\mathrm{V} 6)$ or $\mathrm{U}-\mathrm{C}\left(\mathrm{UC}_{2}\right)$ bond is listed, " C 1 " in Figure 1 is denoted as $\mathrm{C} 1(\mathrm{~V} 6)$.

## Part 4. MOs information for configuration $V$

Figure S1. Density of states (DOS) and characteristic Kohn-Sham MOs diagram with key percentage of AOs contributing to MOs for configuration $\mathbf{V}$ (isodensity value: $\pm 0.02$, only $\alpha$ orbitals). In DOS diagram, the red solid line represents total DOS (TDOS) for relaxed $\mathrm{UC}_{2}+\mathrm{V} 6$ system $(\mathbf{V})$, the black solid line and the blue dash line correspond to the local DOS (LDOS) for fragments of U atom and V6-defective graphene in $\mathbf{V}$, respectively.
