1. Figures

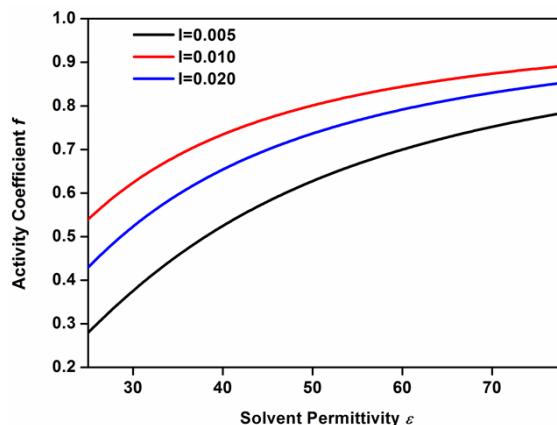

Figure S1. Relationship between activity coefficient f_{\pm} and ϵ . The results were calculated from eqs. 5-7 ($T = 298$ K, $N_A = 6.02 \times 10^{23}$, $k = 1.38 \times 10^{-16}$ erg/K, $e = 4.8024 \times 10^{-10}$ esu, $a = 10^{-1}$ nm, $z_+ = z_- = 1$). The figure demonstrates that solvent permittivity reducing was followed by activity coefficient decrease.

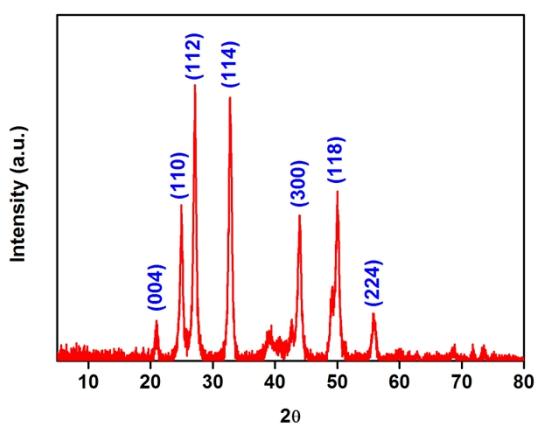

Figure S2. XRD pattern of the resulted precipitates during the CO₂ capture. It shows that the solid is vaterite.

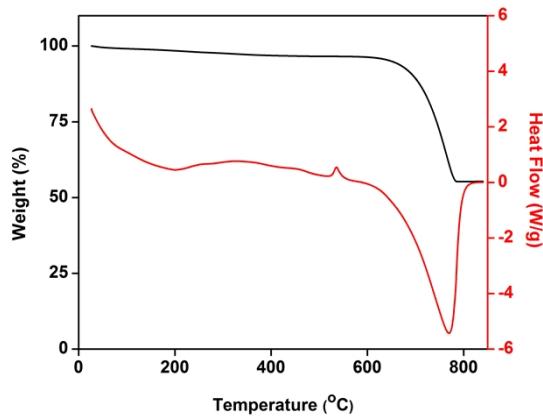

Figure S3. TGA of the resulted precipitates during the CO₂ capture. It confirms that the vaterite do not contain either water or ethanol.

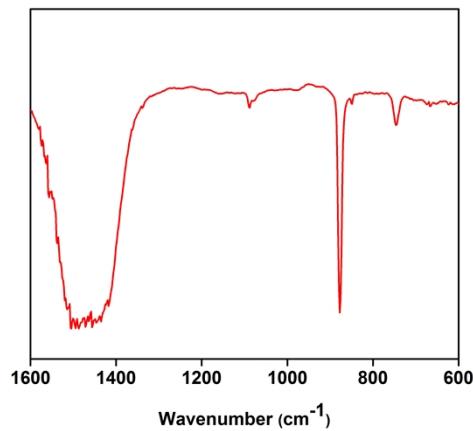

Figure S4. FT-IR of the resulted precipitates during the CO₂ capture. It confirms that the solid is pure vaterite.

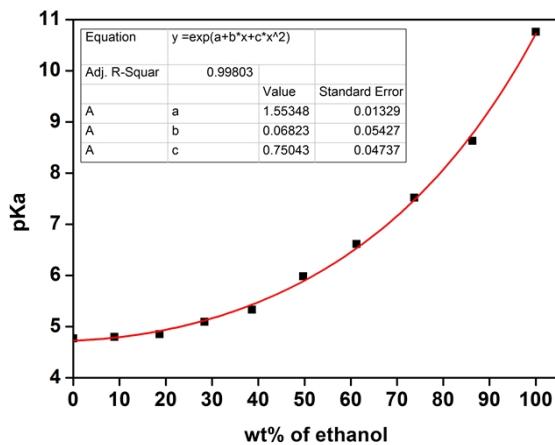

Figure S5. Calculated pK_a values of HAc in the binary solvent (line), which fits the experimental data (solid squares) well.¹

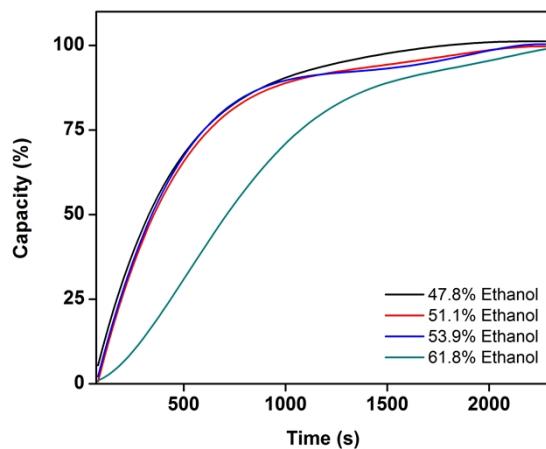

Figure S6. CO_2 absorption kinetics in $\text{Ca}(\text{Ac})_2\text{-C}_2\text{H}_5\text{OH-H}_2\text{O}$. The $\text{Ca}(\text{Ac})_2$ concentration was fixed at 0.08 M.

2. Tables

Table S1. CO₂ capture in different organic/water binary solvent.

| Organic solvent | ϵ_i ^a | ϵ_{eff} ^b | Reactivity ^c |
|---------------------------------|---------------------------|-------------------------------|-------------------------|
| Water | 78.5 | 78.5 | No |
| Glycerol | 46.5 | 55.1 | No |
| 1,2-Ethanediol | 41.4 | 51.2 | No |
| Methanol | 33.0 | 44.7 | Yes |
| Ethanol | 24.5 | 37.9 | Yes |
| Tetraethylene glycol | 20.4 | 34.6 | Yes |
| Tetrahydrofurfuryl alcohol | 13.5 | 28.9 | Yes |
| Diethylene glycol dimethylether | 7.2 | 23.6 | Yes |

^a ϵ_i , permittivity of pure organic solvent.

^b ϵ_{eff} , permittivity of binary solvent.

^c Reactivity means whether CO₂ can be captured by the system containing 0.05 M Ca(Ac)₂ in the binary solvent containing 70% (v/v) organic solvent.

It is better to choose a solvent with low permittivity, low vapor pressure, high boiling point, low viscosity, unreactive and miscible with water, and low toxicity is necessary for CO₂ capture in industry.

Table S2. Fitting of HAc K_a in C₂H₅OH-H₂O binary solvent.^a

| wt % of ethanol | Slope | Intercept | r^2 |
|-----------------|----------|-----------|--------|
| 0 | 2.60E-08 | 8.17E-07 | 0.9996 |
| 9 | 1.17E-08 | -3.35E-07 | 0.9981 |

Table S5. Fitting of enthalpy change of reaction in C₂H₅OH-H₂O binary solvent.^a

| wt % of ethanol | slope | intercept | r ² |
|-----------------|---------|-----------|----------------|
| 47.8 | -3861.5 | 5.4192 | 0.9839 |
| 51.1 | -2853.7 | 3.9259 | 0.9890 |
| 53.9 | 9083.9 | -35.874 | 0.9958 |
| 58.4 | 4139.6 | -19.401 | 0.9631 |
| 61.8 | -3621.6 | 7.157 | 0.9306 |

^a Raw data was measured from Ca(Ac)₂-C₂H₅OH-H₂O system containing 0.08 M Ca(Ac)₂. The result of each fitting was calculated and shown in Figure 3. r² represents the goodness of fit.

3. Discussion

Influence of solubility against acid dissolution. The solubility of CaCO₃ in water is 1.3×10⁻⁵ g/mL at 25 °C.^{2,3} However, the amount of CaCO₃ dissolved by HAc is significantly higher. For example, about 5.3×10⁻⁴ g/mL CaCO₃ dissolved by changing 80 wt% of ethanol to 50 wt% with 0.05 M Ca(Ac)₂, which is 40 times higher than the solubility, indicating that the influence of solubility is regardless to the acid dissolution.
