## 1 Force Fields, FFs, selected for the study.

Potentials in Table 1 are classified according to: a) parametrization method; b) data source for the parametrization; c) if polarizability is explicitly included via the shell model, the QEq or FQ models; d) if the atoms bears formal or partial charges. This work does not intend to show the details of the process of developing FFs, but rather to show their ability to reproduce and predict particular properties of several silica materials, so we refer the reader to the original references (See Table 1) for in depth information. A complete set of parameters is provided in ESI (section 2, Tables 2-4) for all of the models studied.

| FF and Reference             |               | Parametrization / Data Source                        | Polarizabilit |

Table 1: FFs, references, parametrization method, polarizability method and applications.

# 2 8-ring zeolites

Table 2: List of the 64 zeotypes belonging to the Atlas of Zeolite Framework Types (as of May-2012, [16]) containing 8-rings as the largest window. The density has been calculated in the pure silica composition, and its corresponding energy with respect to quartz has been calculated according to a recent study [17]. A plot of density vs. energy is shown in Figure 1.

| #  | Code | Name              | density (Si/1000 $A^8$ ) | Dim | Energy $(kJ/mol SiO_2)$ |

Figure 1: Plot of energy (with respect to quartz) versus density corresponding to the pure silica zeolites indicated in Table 2. Structures below 15 kJ/mol SiO<sub>2</sub> are considered to be stable as pure silica composition according to a previous study [17]. 53 out of 64 structures are below such threshold.

# 7 8-ring diameters obtained from MD simulations for the low density silica polymorphs.

## 7.1 Si-IHW (ITQ-32)

Table 16: 8-ring diameters for Si-IHW, computed as the radial distribution functions of the O-O inter-atomic distances along the MD simulations performed at 300 K, within the NVE ensemble.

| Potential     | D1 [Å]          | D2 [Å]            |
|---------------|-----------------|-------------------|
| BKS           | $3.90{\pm}0.18$ | $4.30 {\pm} 0.20$ |
| PMM06         | $3.93{\pm}0.18$ | $4.27 {\pm} 0.20$ |
| TTAM          | $4.04{\pm}0.21$ | $4.49 {\pm} 0.22$ |
| $\mathbf{BS}$ | $3.38{\pm}0.22$ | $4.35{\pm}0.25$   |
| IZA           | 3.5             | 4.3               |

#### Figure 2: Si-IHW rings

Figure 3: 8-ring diameters computed as the radial distribution function of the O-O distance, computed via MD simulations for Si-IHW.

#### 7.2 Si-LTA (ITQ-29)

Table 17: Window Diameters for Si-LTA, computed as the radial distribution functions of the O-O inter-atomic distances along the MD simulations performed at 300 K, within the NVE ensemble.

| Potential        | D1 [Å]          |
|------------------|-----------------|
| BKS              | $4.10{\pm}0.17$ |
| $\mathbf{PMM06}$ | $4.09{\pm}0.15$ |
| TTAM             | $4.24{\pm}0.19$ |
| BS               | $4.13{\pm}0.17$ |
| IZA              | 4.2             |

Figure 5: 8-ring diameters computed as the radial distribution function of the O-O distance, computed via MD simulations for Si-LTA.

#### 7.3 Si-ITE (ITQ-3)

Table 18: Window Diameters for Si-ITE, computed as the radial distribution functions of the O-O inter-atomic distances along the MD simulations performed at 300 K, within the NVE ensemble.

| Potential     | D1 [Å]          | D2 [Å]          |  |  |
|---------------|-----------------|-----------------|--|--|
| BKS           | $4.19{\pm}0.17$ | $4.35{\pm}0.16$ |  |  |
| PMM06         | $4.22{\pm}0.18$ | $4.36{\pm}0.17$ |  |  |
| TTAM          | $4.34{\pm}0.17$ | $4.53{\pm}0.19$ |  |  |
| $\mathbf{BS}$ | $4.10{\pm}0.24$ | $4.32{\pm}0.35$ |  |  |
| IZA           | 3.8             | 4.3             |  |  |

Figure 7: 8-ring diameters computed as the radial distribution function of the O-O distance, computed via MD simulations for Si-ITE.

## 7.4 Si-ITW (ITQ-12)

Table 19: Window Diameters for Si-ITW, computed as the radial distribution functions of the O-O inter-atomic distances along the MD simulations performed at 300 K, within the NVE ensemble.

| $\operatorname{Potential}$ | D1 [Å]            | D2 [Å]            |
|----------------------------|-------------------|-------------------|
| BKS                        | $3.78 {\pm} 0.23$ | $4.26 {\pm} 0.23$ |
| PMM06                      | $3.83 {\pm} 0.19$ | $4.29 {\pm} 0.20$ |
| TTAM                       | $4.08 {\pm} 0.22$ | $4.76 {\pm} 0.22$ |
| $\mathbf{BS}$              | $4.08{\pm}0.20$   | $4.12 {\pm} 0.24$ |
| IZA                        | 3.9               | 4.2               |

Figure 9: 8-ring diameters computed as the radial distribution function of the O-O distance, computed via MD simulations for Si-ITW.

## 7.5 Si-SAS (SSZ-73)

Table 20: Window Diameters for Si-SAS, computed as the radial distribution functions of the O-O inter-atomic distances along the MD simulations performed at 300 K, within the NVE ensemble.

| Potential | D1 [Å]          |
|-----------|-----------------|
| BKS       | $4.23{\pm}0.16$ |
| PMM06     | $4.22{\pm}0.16$ |
| TTAM      | $4.40{\pm}0.17$ |
| BS        | $4.19{\pm}0.17$ |
| IZA       | 4.2             |

Figure 11: 8-ring diameters computed as the radial distribution function of the O-O distance, computed via MD simulations for Si-SAS.

#### 7.6 Si-CHA

Table 21: Window Diameters for Si-CHA, computed as the radial distribution functions of the O-O inter-atomic distances along the MD simulations performed at 300 K, within the NVE ensemble.

| Potential | D1 [Å]            |
|-----------|-------------------|
| BKS       | $3.77 {\pm} 0.20$ |
| PMM06     | $3.89{\pm}0.17$   |
| TTAM      | $3.92{\pm}0.21$   |
| BS        | $3.65{\pm}0.18$   |
| IZA       | 3.8               |
|           |                   |

Figure 13: 8-ring diameters computed as the radial distribution function of the O-O distance, computed via MD simulations for Si-CHA.

# 8 Relative errors computed for the structural parameters.

Figure 14: Relative error (%) computed for structural parameters of the pure silica polymorphs,  $\alpha$ -quartz,  $\beta$ -quartz and coesite, calculated with the selected FFs.

Figure 15: Relative error (%) computed for structural parameters of pure silica zeolites CHA, LTA, SAS, IHW, ITE and ITW, calculated with the selected FFs.

#### 9 Pore volume of selected low density silica polymorphs.

As additional test, in order to compare the performance of the four selected rigid ions FFs, the pore volume of the minimized structures were computed and compared with the values estimated by nitrogen or argon adsorption experiments, where available. The pore volumes were estimated with the PLATON code [30] employing the Lennard-Jones sigma value of a nitrogen molecule (3.68Å) and the van der Waals diameter of the Argon atom (3.84 Å) according to previous works [31].
