## **Experimental Section**

#### Preparation of solutions with specific pHs

Various pH solutions of PAPS-Pd were prepared by mixing 0.1 mL of PAPS (1 mM) in pure water with 0.1 mL of PdCl<sub>2</sub> (1 mM) in 0.2% hydrochloric acid and diluting in a 10 mL measuring flask with 0.1 M buffer (pH 1 to 13). A buffer solutions were prepared as follows. A solution with pH 1 was prepared with 0.1 M hydrochloric acid. A series of buffers with pH 2 to 6 were prepared by Hydrochloric acid was added to 10 mL of 1 M sodium dihydrogen phosphate to make the total volume to 100 mL. A series of buffers with pH 6.5 to 11 were prepared by 6 M hydrochloric acid was added to 10 mL of 1 M sodium to make the total volume to 100 mL. A buffers with pH 12 and 13 were prepared by 30% sodium hydroxide solution was added to 10 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate solution to make the total volume to 100 mL of 1 M sodium carbonate s

#### Job's plot measurement

For PAPS and  $Pd^{2+}$ : A 20  $\mu$ M solution of PAPS was prepared by dissolving in a 65:35 (v/v) mixture of 1 M sodium carbonate/1 M sodium bicarbonate. Similarly, 20  $\mu$ M solution of  $Pd^{2+}$  (PdCl<sub>2</sub>) was prepared by dissolving in 0.2% hydrochloric acid. Mixture solutions (2.0 mL) of PAPS and  $Pd^{2+}$  at 11 different ratios from 0:2 to 2:0 (v/v) were prepared. After the solutions were allowed to stand for 30 min, the absorbance at 570 nm was measured at room temperature. The absorbance values obtained were plotted against  $[Pd^{2+}]/([PAPS] + [Pd^{2+}])$ , and the complex formation ratio was estimated from the abscissa at the maximum absorbance.

For PAPS-Pd and CN<sup>-</sup>: Each 20  $\mu$ M PAPS-Pd and CN<sup>-</sup> (KCN) solution was prepared by diluting stock solutions. Mixture solutions (2.0 mL) of PAPS-Pd and CN<sup>-</sup> with nine different ratio from 0:2 to 2:0 (v/v) were prepared. After the solutions were allowed to stand for 30 min, the absorbance at 450 nm was measured at room temperature. The absorbance values obtained were plotted against [CN<sup>-</sup>]/([PAPS-Pd] + [CN<sup>-</sup>]), and the complex formation ratio was estimated from the abscissa at the maximum absorbance.

### UV-vis measurement of mixtures of PAPS-Pd and cyanide

The stock solution of PAPS-Pd (100  $\mu\text{M},$  0.3 mL) was mixed with 2.7 mL of water to make the final

concentration of 10  $\mu$ M, and mixed with 6–72  $\mu$ L of 2 mM CN<sup>-</sup>. After mixing the solution for several seconds, UV-vis spectra were measured at room temperature.

#### Measurement of CN<sup>-</sup> in blood samples by König reaction as the reference

 $CN^-$ -spiked blood (10, 20, and 30  $\mu$ M) was applied to the König reaction according to the procedure reported by Epstein.<sup>51</sup> A Conway cell was used for the reaction. Briefly, the solution (0.5 mL) after microdiffusion was placed into a test tube. The chloramine T solution (0.1 mL) was added to the test tube and left for 2 min. Then, the pyridine-pyrazolone reagent (1.5 mL) was added to the test tube. After 40 min, UV-vis spectra were measured. Standard  $CN^-$  solutions were used for preparation of a calibration curve.

**Fig. S1.** <sup>1</sup>H NMR spectra of PAPS, PAPS-Pd, and PAPS-Pd with addition of  $CN^-$  (0.5–5 equiv.) in D<sub>2</sub>O. The red arrows indicated the proton on the 6-position of the pyridine ring.

**Fig. S2.** Job's plot used to determine the complexation ratio between PAPS and Pd<sup>2+</sup>. Corrected absorbance is the difference between measured absorbance ( $A_{obs}$ ) at 572 nm and the product of the molar extinction coefficient of PAPS ( $\varepsilon_{PAPS}$ ) and the initial molar concentration ([PAPS]); Corrected absorbance =  $A_{obs}-\varepsilon_{PAPS}$  [PAPS].

**Fig. S3.** Job's plot for the binding of CN<sup>-</sup> with PAPS-Pd. Corrected absorbance was plotted as a function of the molar ratio of  $[CN^-]/([PAPS-Pd] + [CN^-])$  and the total concentration of PAPS-Pd + CN<sup>-</sup> was 20  $\mu$ M. Corrected absorbance is the difference between the measured absorbance (A<sub>obs</sub>) at 450 nm and the product of the molar concentration of PAPS-Pd ( $\varepsilon_{PAPS-Pd}$ ) and the initial molar extinction coefficient ([PAPS-Pd]); Corrected absorbance = A<sub>obs</sub> -  $\varepsilon_{PAPS-Pd}$  [PAPS-Pd].
