Parallel KIE

Scheme S1. Determination of intermolecular KIE via initial rate (r_H and r_D) analysis. (a) Determination of r_H (averaged) by three times experiments. See also Figure S1. (b) Determination of k_H/k_D by using r_D (1st-3rd run) and r_H (averaged). See also Figure S2.

To a suspension of **1b** or **1b-d₁₅** (1.0 mmol, 10.0 equiv.), TrocNHOtS (36.3 mg, 0.10 mmol, 1.0 equiv.) and K_2CO_3 (20.7 mg, 0.15 mmol, 1.5 equiv.) in PhCl (1.0 mL) was added $\text{Rh}_2(\text{tpa})_4$ (6.8 mg, 0.0050 mmol, 0.05 equiv.) at 20 °C. Aliquots (50 μL) were taken every 2 minutes from the reaction flask for 12 minutes, and filtered through a short silica pad with 1 mL of CDCl_3 for ^{19}F NMR analysis. The yield was determined from the comparison of the integrals of the product peaks relative to the 4-bromobenzofluoride internal standard. The experiments were performed three times for each substrate (Figure S1 and S2). The averaged r_H was calculated by the three runs shown in Figure S1. The k_H/k_D value ($k_H/k_D = 1.0 \pm 0.1$) was determined by using the averaged r_H and r_D (1st-3rd runs) shown in Figure S2.

To a suspension of **1b** (65.1 mg, 0.25 mmol, 5.0 equiv.), **1b-d₁₅** (68.9 mg, 0.25 mmol, 5.0 equiv.), TrocNHOt (18.1 mg, 0.05 mmol, 1.0 equiv.) and K₂CO₃ (10.4 mg, 0.075 mmol, 1.5 equiv.) in PhCl (0.5 mL) was added Rh₂(tpa)₄ (3.4 mg, 0.0025 mmol, 0.05 equiv.) at 20 °C. After being stirred for 12 h at 20 °C, the reaction was quenched by addition of water and extracted with CHCl₃. The organic layer was washed with brine, and dried over Na₂SO₄, filtered, and concentrated *in vacuo*. The residue was purified by preparative thin-layer chromatography purification (CHCl₃/hexane = 2/1) to afford a mixture of **2b** and **2b-d₁₄**. KIE was calculated from the comparison of the integrals between a nitrogen α signal (δ 3.42–3.25 ppm, 2H of **2b**) and a trichloroethyl signal (δ 4.69 ppm, 2H of **2b** and **2b-d₁₄**) in ¹H NMR of a solution of **2b** and **2b-d₁₄** (CDCl₃). The experiments were performed three times and the determined KIE was the average of three runs.

Computational details

All calculation reported in the present study were carried out using density functional theory (DFT) with (U)M06¹⁹ or B3PW91 functional, as implemented in the Gaussian 09 (Revision E.01)²⁰. For geometry optimizations, the 6-31G(d,p) basis set was used for the H, C, N, O, Si, Cl elements, and the LANL2DZ²¹ basis set and pseudopotential for Rh. Based on these optimized geometries, single-point energy calculations were performed using the 6-311++G(2d,2p) basis set for the H, C, N, O, Si, Cl elements, and the SDD²² basis set and pseudopotential for Rh with solvents effects simulated by SMD²³ solvent model (chlorobenzene). The stationary points were confirmed as minima (no imaginary frequencies) or transition state (only one imaginary frequency) by analytical frequency calculations as the same theory level as the geometry optimizations. Computational time was generously provided by the Supercomputer Laboratory in the Institute for Chemical Research of Kyoto University.
