General: All reagents and solvents were commercial reagent grade and were used without further purification unless otherwise noted. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Varian mercury- 300 spectrometer and JEOL JNM-ECA600 spectrometer, and chemical shifts were reported on the delta scale in ppm relative to residual chloroform ( $\delta=7.26$ and 77.0 for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, respectively). UV/vis absorption spectra were recorded on a JASCO V-560 spectrometer. High resolution mass spectra (HRMS) were recorded on a Thermo Scientific LTQ Orbitrap XL hybrid FTMS by electron splay ionization (ESI) methods. Melting points (M.p.) were measured with a Yanagimoto micro melting point apparatus. Infrared (IR) spectra were recorded on a JASCO FT/IR-4600 spectrometer with ZeSe ATR accessory. Preparative separations were performed by silica gel gravity column chromatography (Silica Gel 60 N (spherical, neutral)). Recycling preparative GPC-HPLC separations were carried out on JAI LC-908s using preparative JAIGEL-2H, 2H, 1H columns in series. Size exclusion chromatogram was recorded on Shimadzu LC-20AC with CTO-20AC accessory and TOSOH UV-8011 detector using preparative Shodex GPC-K-804, K-803, K-802.5 columns in series. The number-average molecular weights ( $M_{\mathrm{n}}$ ) of the poly- $\mathbf{1}$ were determined by the size exclusion chromatography (SEC) based on polystyrene standards in chloroform. $\mathbf{4}^{[1]}, \mathbf{5}^{[2]}, \mathbf{6}^{[3]}$, and $(R)-,(S)-\mathbf{1 1}{ }^{[4]}$ were synthesized according to reported methods.

Scheme S1. Synthesis of poly-1.

Synthesis of fullerene-pendant polyphenylacetylene poly-1:
$3(63 \mathrm{mg}, 200 \mu \mathrm{~mol}), 4(10 \mathrm{mg}, 11 \mu \mathrm{~mol}), \mathrm{NEt}_{3}(300 \mu \mathrm{~L}, 2.2 \mathrm{mmol})$, and dry monochlorobenzene ( 3 mL ) were placed in Schlenk-type tube. The mixture was subjected to three cycles of freeze-pump-thaw, and then $\mathrm{Rh}\left(\mathrm{BPh}_{4}\right) \mathrm{Cl}(1.1 \mathrm{mg}, 2.1$ $\mu \mathrm{mol}$ ) in dry monochlorobenzene ( 1 ml ) was added to the resultant solution. After being stirred for 24 h at $30^{\circ} \mathrm{C}$ under an argon atmosphere in the dark, the reaction mixture was diluted with chloroform, and passed through celite (chloroform, eluent). The organic layer was concentrated in vacuo. The crude product was passed through GPC column to remove unreacted starting materials to afford desired product poly-1 (38 mg, $52 \%$ ) as a brown solid.

Synthesis of calix[5]arene mono alcohol (S)-2b:
To solution of $\mathbf{2 a}(18 \mathrm{mg}, 8.1 \mu \mathrm{~mol})$ in DMF $(0.1 \mathrm{ml})$ was added $\mathrm{CuI}(0.20 \mathrm{mg}, 1.1 \mu \mathrm{~mol})$ and dry diisopropylamine $(0.10 \mathrm{ml}, 0.71 \mathrm{mmol})$. After being stirred for 15 min at room temperature under an argon atmosphere, 2-methyl-3-butyn-2-ol $(1.4 \mu \mathrm{l}, 24 \mu \mathrm{~mol})$ was added. After being stirred for 15 min at room temperature under argon atmosphere, $\mathrm{Pd}(\mathrm{dppf}) \mathrm{Cl}_{2}(1.2 \mathrm{mg}, 1.6 \mu \mathrm{~mol})$ was added to the resultant solution. After being stirred for 1 h at $60^{\circ} \mathrm{C}$ under an argon atmosphere in the dark, the reaction mixture was passed through celite (dichloromethane, eluent) and diluted with dichloromethane. The organic layer was washed with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ and saturated aqueous NaCl , dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The crude product was purified by GPC and column chromatography on silica gel ( $5 \%$ THF in toluene, eluent) to yeild desired product $\mathbf{2 b}(5.6 \mathrm{mg}, 33 \%)$ as a yellow solid.
