General: All operations were performed under an argon atmosphere. ^1H , ^{13}C and ^{31}P spectra were recorded on an ECS-400 (400 MHz for ^1H , 128 MHz for ^{11}B , 100 MHz for ^{13}C , and 160 MHz for ^{31}P), an ECX-400 (400 MHz for ^1H and 160 MHz for ^{31}P), or an ECZ-500 (500 MHz for ^1H , 125 MHz for ^{13}C , and 200 MHz for ^{31}P) spectrometer in CDCl_3 , C_6D_6 , acetone- d_6 , or dmso- d_6 . Chemical shifts are expressed in parts per million (ppm) downfield from tetramethylsilane (δ_{H} 0.00, δ_{C} 0.00), $\text{BF}_3\bullet\text{OEt}_2$ (δ_{B} 0.00), 85% H_3PO_4 aq. (δ_{P} 0.00), or C_6F_6 (δ_{F} -163.00) and are referenced to residual solvents (δ_{H} 7.26 and δ_{C} 77.0 for chloroform, δ_{H} 7.16 and δ_{C} 128.06 for C_6H_6 , δ_{H} 7.05 and δ_{C} 206.26 for acetone- d_6 , and δ_{H} 2.50 for dmso- d_6). IR spectra were recorded on an FT/IR-460 plus (JASCO Co., Ltd.) with an ATR PRO450-S accessory (JASCO Co., Ltd.). High resolution mass spectra (HRMS) were recorded on a BRUKER micrOTOF II and a JEOL JMS-T100 spectrometer. Silica Gel 60 (Kanto Chemical Co., Inc.) was used for flash column chromatography. A Merck Kieselgel 60 F₂₅₄ (0.25 mm thickness, coated on glass 20 x 20 cm²) plate was used for analytical thin layer chromatography (TLC). THF, Et₂O, hexanes and toluene were purified by solvent purification system of Glass-Contour. *n*-Octane was purchased from Tokyo Chemical Industry and degassed by freeze-pump-thaw technique and dried over 4A molecular sieves. Benzene- d_6 was purchased from ACROS chemicals and dried and degassed by benzophenone ketyl. Chloroform- d was purchased from Kanto Chemicals. Unless otherwise noted, materials were purchased from Sigma-Aldrich Corporation, FUJIFILM Wako Pure Chemical Corporation, Tokyo Chemical Industry Corporation, and Kanto Chemical Corporation.

General procedure for the synthesis of aryl diphenylphosphinites

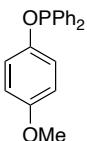

In a 100 mL two-neck flask, a phenol derivative (10.0 mmol) was dissolved in Et_2O (30.0 mL) under an argon atmosphere. The flask was cooled to 0 °C in an ice-bath, and triethylamine (10.0 mmol) and chlorodiphenylphosphine (10.0 mmol) were successively added. The flask was allowed to stand at room temperature and stirred overnight. The solution was filtered through a short pad of alumina and Celite®, and the filtrate was concentrated under reduced pressure to give the product.

General procedure for C–H borylation of aryl diphenylphosphinites

Procedure A

A solution of $[\text{RuCl}_2(\text{p-cymene})]_2$ (0.9 mg, 1.5 μmol) and aryl diphenylphosphinite **1** (0.30 mmol) in *n*-octane (1.5 mL) was placed in a glass tube (inside diameter = 1.7 cm, length = 18 cm) equipped with a three-way stop cock under Ar. HBpin (47.4 μL , 0.33 mmol) was added to the solution at room temperature, and the glass tube was closed. Then the mixture was stirred at 150 $^\circ\text{C}$ in the closed system for 6 h. 1N HCl aq. was added to the solution at room temperature, and the mixture was stirred for 24 h. The mixture was extracted with AcOEt three times, and the combined organic layers were washed with brine and dried over MgSO_4 . After filtration to remove the drying agent, the filtrate was evaporated to give a crude product. To a MeOH solution (1.5 mL) of the crude product was added KHF₂ (93.7 mg, 1.2 mmol) at room temperature, and the mixture was stirred for 24 h. The suspension was evaporated at 40 $^\circ\text{C}$ for 20 min, and residual white solids were dissolved in acetone (5.0 mL). After insoluble salts were filtered off, the filtrate was concentrated to ca. 1 mL volume. Then, toluene (ca. 1 mL) was added, and the remaining acetone was removed under reduced pressure to give the suspension in toluene. The resulting beige solids were collected by filtration and rinsed with excess *n*-hexane and a small amount of cold MeOH (ca. 0 $^\circ\text{C}$) to give aryl trifluoroborate **2**.

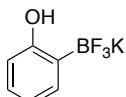

Procedure B

A solution of $[\text{RuCl}_2(\text{p-cymene})]_2$ (0.9 mg, 1.5 μmol) and aryl diphenylphosphinite **1** (0.30 mmol) in *n*-octane (1.5 mL) was placed in a glass tube (inside diameter = 1.7 cm, length = 18 cm) equipped with a three-way stop cock under Ar. HBpin (47.4 μL , 0.33 mmol) was added to the solution at room temperature, and the glass tube was closed. Then the mixture was stirred at 150 $^\circ\text{C}$ in the closed system for 6 h. 1N HCl aq. was added to the solution at room temperature, and the mixture was stirred for 24 h. The mixture was extracted with AcOEt three times, and the combined organic layers were washed with brine and dried over MgSO_4 . After filtration to remove the drying agent, the filtrate was evaporated to give a crude product. To a MeOH solution (1.5 mL) of the crude product was added KHF₂ (93.7 mg, 1.2 mmol) at room temperature, and the mixture was stirred for 24 h. After the suspension was evaporated at 40 $^\circ\text{C}$ for 20 min, the resulting beige solid

was collected by filtration and rinsed with a small amount of cold MeOH (ca. 0 °C) to give aryl trifluoroborate **2**.

This reaction should be conducted inside an explosion proof wall. This reaction is performed in a sealed glass tube at 150 °C which is over the boiling point of *n*-octane. Furthermore, H₂ is generated during the reaction. The volume of the dead space inside the glass ware is ca. 34.5 cm³.
