General Methods

Reactions, unless otherwise stated, were conducted under a positive pressure of argon in oven-dried glassware. Water for the hydration reactions was deionized water. Commercially available solvents and reagents were used as purchased unless otherwise noted. Analytical thin layer chromatography was performed using aluminium plates precoated with silica gel 60 F\textsubscript{254} (0.2 mm). Flash chromatography employed 230-400 mesh silica gel. Solvents used for chromatography are quoted as volume/volume ratios.

NMR spectroscopy was performed at 298 K using an Avance III HD 400 (400.1 MHz, \textsuperscript{1}H; 100.6 MHz, \textsuperscript{13}C, 376.5 MHz, \textsuperscript{19}F) or an Avance III 300 (300 MHz, \textsuperscript{1}H; 75 MHz, \textsuperscript{13}C; 282.5 MHz, \textsuperscript{19}F). Data is expressed in parts per million (ppm) downfield shift from tetramethylsilane with residual solvent as an internal reference (δ 7.26 ppm for chloroform, 5.27 ppm for dichloromethane) and is reported as position (δ in ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet), coupling constant (J in Hz) and integration (number of protons). \textsuperscript{13}C NMR spectra were recorded at 298 K with complete proton decoupling. Data is expressed in parts per million (ppm) downfield shift relative to the internal reference (δ 77.2 ppm for the central peak of deuterated chloroform).

Infrared spectra were obtained on a ThermoNicolet Avatar 370 FT-IR spectrometer and are reported in wavenumbers (cm\textsuperscript{-1}). HRMS were performed at the Bioanalytical Mass Spectrometry Facility within the Mark Wainwright Analytical Centre at the University of New South Wales on an Orbitrap LTQ XL (Thermo Fisher Scientific, San Jose, CA, USA) ion trap mass spectrometer.

Microwave reactions were carried out in 10 mL microwave vials on CEM Discover – SP W/ACTIVENT 909155 or 10 ml vials on Anton Paar Monowave 300.

*a Reaction conditions: catalyst (0.1 mmol), aldehyde 1a (1.0 mmol) and water (5.0 mmol) in DMF (2a, 1.0 mL); b Time of complete consumption of the starting material as confirmed by ¹H NMR; c Yield of isolated product.

An oven-dried 4 mL reaction vessel was charged with 2-naphthaldehyde 1a (1.0 mmol, 1.0 equiv), acid catalyst (0.1 equiv), H₂O (5.0 equiv) and DMF 2a (1.0 mL, ~ 13 equiv). The reaction vessel was closed and heated to 150 °C. When the starting material 1a was completely consumed (monitored by TLC or ¹H NMR), the reaction was cooled to rt. Brine (10 mL) was added to the reaction mixture, followed by the extraction of the products with ether (3 x 10 mL). The organic layers were combined, dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residues were then purified by column chromatography (SiO₂, dichloromethane/methanol 20 : 1 to 10 : 1) to obtain N,N-dimethyl-1-(naphthalen-2-yl)methylamine (3a) as the product.

General Procedures for Substrate Scope Studies

**Procedure A:** An oven-dried 4 mL reaction vessel was charged with carbonyl compound 1 (1.0 mmol, 1.0 equiv), TfOH catalyst (5 mol%), H₂O (2.0 equiv) and formamide 2 (1.0 mL). The reaction vessel was closed and heated to 150 °C for 8 h then cooled to rt. Brine (10 mL) was added to the reaction mixture, followed by the extraction of the products with ether (3 x 10 mL). The organic layers were combined, dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residues were then purified by column chromatography (SiO₂, dichloromethane/methanol 20 : 1 to 10 : 1) to obtain product 3.

**Procedure B:** An oven-dried 4 mL reaction vessel was charged with carbonyl compound 1 (1.0 mmol, 1.0 equiv), TfOH catalyst (5 mol%), H₂O (2.0 equiv), formamide 2 (5.0 equiv) and HFIP (0.5 mL). The reaction vessel was closed and heated to 60 °C for 12 h then cooled to rt. Brine (10 mL) was added to the reaction mixture, followed by the extraction of the products with ether (3 x 10 mL). The organic layers were combined, dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residues were then purified by column chromatography (SiO₂, dichloromethane/methanol 20 : 1 to 10 : 1) to obtain product 3.

General Procedures for the Direct Reductive Amination in Ethyl Formate

A screw-cap high pressure reaction vessel was charged with tetrahydroisoquinoline 7 (1.0 mmol, 1.0 equiv); carbonyl compound 9 (1.2 equiv), TfOH catalyst (10 mol%), H₂O (2.0 equiv) and ethyl formate (4.0 mL). The reaction vessel was sealed carefully and heated to 100 °C for 24 h. The reaction was cooled to rt. Brine (10 mL) was added to the reaction mixture, followed by the extraction of the products with ether (3 x 10 mL). The organic layers were combined, dried over anhydrous sodium sulfate and concentrated under reduced pressure. The residues were then purified by column chromatography (SiO₂, dichloromethane/methanol 20 : 1 to 10 : 1) to obtain product 10.

Synthesis of polyamines 16: Glutaraldehyde 14 (50 wt. % in water, 20 mmol) and 1,3-diaminopropane 15 (20 mmol) and TfOH (2 mmol) was dissolved in ethyl formate (5 mL) in a screw-cap high pressure tube. The reaction mixture was heated to 100 °C for 48 h. Water and excess ethyl formate were removed under reduced pressure. Mass balance and \(^1\)H NMR spectrum of the crude residues suggested that ~80% of the monomers have been converted to a range of polyamines (16).

\[(^1\text{H NMR, 298K, } d_6-\text{DMSO})\]

Gel permeation chromatography (GPC) was employed to measure the molecular weights and dispersities of the synthesised polymers. GPC was carried out using UFLC Shimadzu Prominence system comprising a DGU-20A degasser, a LC-20AD pump, a SIL-20A HT automatic injector, a CTO-20A column oven, a RID-10A refractive index detector, a RF-20A fluorescence detector and a SPD-M20A Diode array detector Shimadzu UV/vis detector. A 50 x 7.8 mm guard column and two 300 x 7.8 mm linear columns (10^4 and 10^5 Å pore size, 5 μm particle size) were used for the analyses. \(N,N'\)-dimethylacetamide (DMAc) (HPLC grade, including 0.05% w/v of 2,6-dIBUTYL-4-METHYLPHENOL (BHT) and 0.03% w/v of LiBr) with a flow rate of 1 mL min\(^{-1}\) and a constant temperature of 50 °C was used as the mobile phase. The unit was calibrated using commercially available linear poly(methyl methacrylate) standards (0.5- 1000 kDa, Polymer Laboratories). The samples (4 mg mL\(^{-1}\)) were dissolved in DMAc and filtered through 0.45 μm PTFE filters prior to injection of 25 μL.
GPC data suggested that the synthesized polymer had an average molecular weight of 2400 g/mol with a dispersity ($D$) of around 1.6 (see above graph at retention time ~ 18-22 min). It should be noted that the whole GPC peak of the polymer was not able to be observed due to overlapping with GPC solvent peaks.
