EXPERIMENTAL SECTION

Chemicals

Trimethylamine, N,N-Dimethylbenzylamine, N,N-Dimethylcyclohexylamine, 1,4-Dibromobutane, Tetrahydrofuran (THF), K$_2$CO$_3$, and anhydrous acetone were obtained from J&K. 4,4',4'',4'''-(ethene-1,1,2,2-tetrayl) tetraphenol (TPE-OH) was purchased from Shanghai Tensus Biotech Co., LTD. Guanidine hydrochloride (GndHCl) was purchased from Aladdin. Bovine serum albumin (BSA), human serum albumin (HSA), hemoglobin (Hb), catalase (CAT), cytochrome c (CytC), lysozyme (Lys), myoglobin (Myo), Pepsin (Pep), trypsin (Try) and transferrin (Tf) were obtained from Sigma-Aldrich (USA). Ultrapure Milli-Q water (18 MΩ⋅cm) was used in the whole experiments. Serums samples of healthy people and cancer patients were collected and approved by the Affiliated Hospital of Qingdao University under the agreement of the human subjects. Moreover, serums collection was approved by Institutional Review Board of the Affiliated Hospital of Qingdao University.

Instruments

Fluorescence measurements were performed on a FLS-1000 fluorescence spectrometer (Edinburgh, UK). Fluorescence images of 96-well plates were obtained using a VILBER bioimaging system (Quantum, France). Confocal images were collected using a Laser scanning confocal microscope (Olympus FV1000). The docking between probes and proteins was simulated by AutoDock 4.2. All the docking simulations were performed for 500 runs. Dynamic light scattering (DLS) experiment was performed on a Nano-ZS Zetasizer.
ZEN3600 (Malvern, UK). $^1$H-NMR and $^{13}$C-NMR spectra were recorded with a Bruker Avance 500 spectrometer. Full-scan negative (-) mode was used to obtain the m/z information on a Mass Spectrometer (Thermo-Fisher, Q-Exactive).

**Synthesis of TPE-OB$_r$:** Synthesis of 1, 1, 2, 2-tetrakis(4-(4-bromobutoxy) phenyl)ethane: Hydroxylated TPE (TPE-OH) (0.5 g, 1.26 mM), 1,4-dibromobutane (3.0 mL, 24.85 mM) and anhydrous K$_2$CO$_3$ (1.04 g, 7.56 mM) were dissolved in anhydrous acetone (30 mL) in round-bottomed flask. The solution was refluxed overnight. The product was washed by acetone and rotary evaporated twice. The crude product was purified by silica gel column chromatography using ethyl acetate/petroleum ether (1: 5) as eluent. After drying under vacuum, product (886 mg, 75%) was obtained as a white powder. $^1$H-NMR (400 MHz, CDCl$_3$): $\delta$ (ppm) = 6.94 (d, J = 8.0 Hz, 8H), 6.65 (d, J = 4.0 Hz, 8H), 3.95 (t, J = 8.0 Hz, 8H), 3.51 (t, J = 8.0 Hz, 8H), 2.11-2.05 (m, 8H), 1.96-1.91 (m, 8H).

**Synthesis of TPE-NRs:** The mixture of 1, 1, 2, 2-tetrakis (4-(4-bromobutoxy) phenyl) ethane (TPE-OBr) (500 mg, 0.625 mM) and the corresponding amine (15.75 mM) was refluxed in THF (40 mL) for 48 h. The obtained product was washed several times with THF, and TPE-NRs were obtained by recrystallization. The characterization of three TPE-NRs is followed:

TPE-NR1: $^1$H-NMR (500 MHz, D$_2$O): $\delta$ (ppm) = 6.91 (d,J=5.0 Hz, 8H), 6.44 (s, 8H), 3.49 (s, 8H), 3.21 (d,J=5.0 Hz, 8H), 3.19 (s,8H), 2.99 (s, 36H), 1.55 (s, 16H). $^{13}$C-NMR (500MHz, D$_2$O): $\delta$ (ppm) = 156.49, 139.23, 137.06, 132.13, 114.01, 67.21, 65.94, 59.53, 52.92, 25.42, 19.39. ESI-MS: m/z calculated for C$_{54}$H$_{84}$N$_4$O$_4$$^+$: 213.2, found: 213.4.

TPE-NR2: $^1$H-NMR (500 MHz, D$_2$O): $\delta$ (ppm) = 6.75 (s, 8H), 6.46 (s, 8H), 3.63 (s, 8H), 3.55 (t, J=15.0Hz, 4H), 3.21 (s, 8H), 2.88 (s, 24H), 1.93 (s, 8H), 1.77 (s, 8H), 1.60 (s, 8H), 1.38 (d, J=5.0Hz, 8H).
Hz), 1.14 (d, J=10.0 Hz, 8H), 1.07 (t, J=10.0 Hz, 8H). $^{13}$C-NMR (500MHz, D$_2$O):$\delta$ (ppm) = 156.74, 138.74, 136.86, 132.27, 114.04, 71.42, 67.82, 67.12, 62.23, 57.39, 48.28, 25.58, 25.11, 24.32, 18.69, 16.81. ESI-MS: m/z calculated for C$_{74}$H$_{116}$N$_4$O$_4$+: 277.2, found: 281.2.

TPE-NR3: $^1$H-NMR (500 MHz, D$_2$O):$\delta$ (ppm) = 7.22 (s, 8H), 7.06 (s, 8H), 6.97 (s, 8H), 6.74 (s, 8H), 6.36 (s, 8H), 4.22 (s, 8H), 3.54 (t, J=15.0 Hz, 8H), 2.85 (s, 32H), 1.76 (s, 8H), 1.51 (s, 8H), 1.07 (t, J=15.0 Hz, 8H).

$^{13}$C-NMR (500MHz, D$_2$O):$\delta$ (ppm) = 156.69, 138.46, 136.77, 132.63, 129.12, 127.30, 113.87, 66.37, 61.64, 57.38, 50.56, 25.14, 19.12, 16.78. ESI-MS: m/z calculated for C$_{78}$H$_{100}$N$_4$O$_4$+: 289.2, found: 289.2.

**Protein detection and discrimination:** For protein identification: ten kinds of target proteins (2.0 μL, 40 mg/mL ) were added to 200 μL of three TPE-NRs probes (2 μM) on a 96-well plate, respectively, and incubated at room temperature for 10 minutes. Subsequently, fluorescent images were obtained directly using a VILBER bioimaging system. The obtained relative fluorescence intensities of TPE-ARs before and after incubation with proteins [(I – I$_0$)/I$_0$] were processed by principal component analysis (PCA) using statistical analysis software simca (Here, I$_0$ is the fluorescence intensity of TPE-ARs before adding proteins, I is the fluorescence intensity of TPE-ARs after adding proteins). For protein identification: 2.0 μL of serums from prostate cancer, liver cancer, rectal cancer and healthy people were added to 200 μL of three TPE-NRs probes (2 μM) on a 96-well plate, respectively, and incubated at room temperature for 10 minutes. Then, fluorescent images were obtained directly using a VILBER bioimaging system.
The obtained relative fluorescence intensities of TPE-ARs before and after incubation with serums \([\frac{(I - I_0)}{I_0}]\) were processed by principal component analysis (PCA) using statistical analysis software simca (Here, \(I_0\) is the fluorescence intensity of TPE-ARs before adding serums, \(I\) is the fluorescence intensity of TPE-ARs after adding serums).

Fig. S4 $^1$H-NMR (A), $^{13}$C-NMR (B) and high-resolution mass spectra (C) of TPE-NR3.
Fig. S5 Size distribution of (A) TPE-NR1, (B) TPE-NR2 and (C) TPE-NR3 aggregates in THF (f_{THF}=96%) (TPE-NRs concentration: 2 μM).

Fig. S6 The best docked complex between (A) TPE-NR1 and Tf, (B) TPE-NR1 and BSA, (C) TPE-NR1 and CAT, (D) TPE-NR2 and BSA, (E) TPE-NR3 and BSA. The TPE-NRs are represented as in ball and stick mode, with carbon, oxygen, and nitrogen atoms colored in yellow, red, and blue, respectively. The crystal structure of proteins are represented as cartoon, with α-helices, β-sheets, and fibril. The α-helices of Tf, BSA and CAT are colored in green, red, and blue, respectively. The
key amino acid residues in the crystal structures of proteins are pointed out in enlarged images. PDB number: Tf: 1D3K; BSA: 3V03; HSA: 1DGB.

PCA plots for the identification of (C) ten proteins (400 μg/mL) and (D) random binary or ternary mixtures of proteins in the presence of human urine (total protein concentration: 400 μg/mL, n = 3). (TPE-NRs concentration: 2 μM)
Fig. S14 PCA plot for identification 30 blind samples in the presence of (A) human serum and (B) urine. (n = 3)

For blind testing, we randomly selected 30 samples from these 10 proteins and added them to human serum and urine, respectively, to obtain 30 blind test samples (The final added protein concentration was 400 g/mL for each blind sample). Each blind sample is covered with a numbered label paper. Then, these 30 blind sample were identified by the AIE based sensor array. By comparing the result (Fig. S14A and Fig. S14B) with the standard data (Data in Figure 13A and C), 30 blind test samples were confirmed to be identified with a discriminative accuracy of 100%, respectively.
