MATERIALS AND METHODS

Materials and Chemicals

Formaldehyde (CH₂O), formaldehyde-d₂ (CD₂O), formaldehyde-¹³C, d₂ solution (D¹³CDO), 4-(4,6-Dimethoxy-1,3,5-triazin-2-yl)-4-morpholinium tetrafluoroborate (DMTMM), N-methylmorpholine (NMM), sodium cyanoborohydride (NaCNBH₃), sodium cyanoborodeuteride (NaCNBD₃), N-alpha-(tert-Butoxycarbonyl)-L-lysine (Boc-lysine-OH), deuterium oxide (D₂O), dithiothreitol (DTT), iodoacetamide (IAA), acetonitrile (ACN), trifluoroacetic acid (TFA), formic acid (FA), and triisopropylsilane (TIS) were obtained from Sigma-Aldrich (St. Louis, MO). All isotopic reagents for the synthesis of acetylated lysine including acetic anhydrides (acetic anhydride 1,1',2,2'-¹³C₄ and acetic anhydride 1,1'-¹³C₂) and L-lysine-2HCl (L-lysine-2HCl ¹³C₆, L-lysine-2HCl ¹³C₆, ¹⁵N₂, L-lysine-2HCl 4,4,5,5-D₄ and L-lysine-2HCl 3,3,4,4,5,5,6,6-D₈) were purchased from Cambridge Isotopes (Cambridge, MA). Dichloromethane (DCM), N,N-dimethylformamide (DMF), and pyridine was bought from Shanghai Chemical Reagent Co., Ltd. (Shanghai, China). BL21 (DE3)-competent E. coli was from Merck & Co. Inc. Pierce™ BCA Protein Assay Kit was obtained from ThermoFisher Scientific (San Jose, CA). Distilled water was purified with a Milli-Q system (Waters Corp., Milford, MA). Serum samples were generously provided by Department of Clinical Laboratory, Cancer Hospital of Guangxi Medical University. Trypsin for cell culture was acquired from Beijing HuaLishi Technologies Co., Ltd. (Beijing, China). The standard peptides (ESTLHLVLR) were synthesized from TOP-peptide Co., Ltd. (Shanghai, China) with stated purities of >95%. Isotopic mdCATs were purified by one C18 column from HALO.

Synthesis of Mass Defect-based Carboxyl-Active Tag (mdCAT)

The synthesis of N,N-dimethylated lysine was inspired by previous report.¹ Boc-lysine-OH (246.3 mg, 1 mmol) and sodium cyanoborohydride (NaCNBD₃ or NaCNBH₃, 4.7 mmol) was dissolved in D₂O (4.7 mmol NaCNBD₃ in 426.8 μL D₂O, 4.7 mmol NaCNBH₃ in 440.0 μL D₂O). Formaldehyde-d₂ (CD₂O, 1214.7 μL, 20 wt. %) or formaldehyde-¹³C, d₂ solution (D¹³CDO, 1252.3 μL, 20 wt. %) was then dropwisely added on ice. The mixture was stirred at 37 °C for 2 h after cooling down. The target product was purified by silica gel flash column chromatography (MeOH/H₂O = 95/5) followed by lyophilization to a pale yellow solid. Boc-deprotections were carried out for 30 min at room temperature with TFA/TIS/H₂O (95/2.5/2.5) and washed with DCM/H₂O (vol/vol = 3/1). After removing organic layer, the N,N-dimethylated lysine was dried in a rotary evaporator and stored at -20 °C for further use.

N α , N ϵ -diacetyl-lysine was synthesized from L-lysine-2HCl (L-lysine-2HCl ¹³C₆, L-lysine-2HCl ¹³C₆, ¹⁵N₂, L-lysine-2HCl 4,4,5,5-D₄ or L-lysine-2HCl 3,3,4,4,5,5,6,6-D₈ dissolved in H₂O, 1 mmol), acetic anhydride (acetic anhydride 1,1'-¹³C₂, acetic anhydride, 1,1',2,2'-¹³C₄ or light acetic anhydride, 9.6 mmol), and pyridine (14.1 mmol). After the solution stirred at 0 °C for 20 h, the target molecular was washed with ACN (10 mL, 3 times) and lyophilized under reduced pressure.

The synthetic procedure leading to the peptide bond of mdCAT included formation of N-triazinylammonium tetrafluoroborate by treating N α , N ϵ -diacetyl-lysine (239.1 mg, 1 mmol) with appropriate DMTMM (328.1 mg, 1mmol, dissolved in 6.6 mL DMF) and NMM (328.1 μL) 2 h at 0 °C, followed by the addition of the N,N-dimethylated lysine (217.3 mg, 1.2 mmol) at room temperature for another 8 h. After the solvent evaporating in vacuum, the residue was purified by a C18 column to give mdCATs as transparent solid. The general synthetic procedures are shown in Table 1.

Purification and Detection of MdCAT reagents

The synthesized mdCATs were purified with C18-HPLC (Buffer A: water, 0.1% TFA; gradient: 0-20 mins 100% A; flow rate: 1 mL/min). After separating, they were injected into electrospray ionization (ESI)-based LTQ Orbitrap XLTM (Thermo Fisher Scientific, San Jose, CA) with a gas flow rate of Sheath gas 10 and Aux gas 5, then detected under positive ion mode. The duration of each injection was set as 0.80 min and the analyzer was calibrated every single day using Pierce™ Reserpine Standard for LC-MS (ThermoFisher Scientific). The instrument was set to complete a full mass scan from mass-to-charge ratio (m/z) range of 100-1000 with resolution of 60 000 (m/z at 400) in the Orbitrap without setting higher energy C-trap dissociation (HCD) for further fragmentation.

Sample Selection and Preparation

Serum samples (nine healthy individuals and twelve liver cancer patients) used in this study were generously provided by Department of Clinical Laboratory, Cancer Hospital of Guangxi Medical University. All samples were selected with no bias and quantified with codes (such as 1HC, 2HC and so on) to hide the specific information of patients. The overall study was reviewed and approved by the SHAPHC Ethic Committee (approved no. 2019(KY-E-18)). Human serum samples and BL21 (DE3) were resuspended in lysis buffer containing 8 M urea, 1× Halt Protease, and inhibitor cocktail for 20 min on ice and sonicated at 4 °C (five pulses for 10 s, 35% power). The supernatant of the lysates was collected after centrifugation (14000 rcf, 20 min at 4 °C). Then the protein samples were diluted to 2 mg/mL with 50 mM ammonium bicarbonate buffer. After reducing by 10 mM DTT at 56 °C for 1h, the free thiol were alkylated by 30 mM IAA in darkness for 30 min at room temperature. Samples were then digested by trypsin with enzyme-substrate ratio of 50:1 at 37 °C for 16 h. Solvent of these tryptic peptides were evaporated by lyophilizer after desalting and stored at -20 °C.

Sample Labeling

To the reaction vessel, 24 µg mdCAT and 6.6 µg DMTMM was dissolved in 20 µL DMF, followed by addition of 1 µL NMM. After stirring the mixture at 0 °C for 2 h, the in situ N-triazinylammonium tetrafluoroborate were formed, which were then transferred to the sample vial containing 1 µg digests for another 4 h at 37 °C.

Matrix-Assisted Laser Desorption Ionization Time-Of-Flight Mass Spectrometry (MALDI-TOF MS)

Analysis

The synthesized peptides before and after mdCATs labeling were examined by MALDI-TOF MS. CHCA matrix was dissolved in 50% ACN and 0.1% TFA at a concentration of 5 mg/mL. Samples and matrix (1 µL each) were spotted on a target plate for MS analysis. Myoglobin proteolytic peptides were used for mass calibration. All MALDI-TOF MS assays were carried out on a 5800 Proteomics Analyzer (AB SCIEX) in positive mode with a Nd: YAG laser at 355 nm, setting 400 Hz repetition rate and 20 kV acceleration voltage.

Liquid Chromatography Tandem Mass Spectrometry Analysis

Mass spectrometric acquisition of equally mixed E. coli sample set: Digested samples labeling mdCATs were mixed at equal ratio by weight and dried in vacuo. After reconstituting in buffer (98% H₂O, 2% ACN and 0.1% FA), each sample was injected onto a C18 reversed-phase analytical column (Acclaim PepMap C18, 100Å 75 µm × 25 cm) in mobile phase A (0.1% FA in water) and gradient-eluted with mobile phase B (0.1% FA in ACN). Eluted peptides were analyzed by liquid chromatography tandem mass spectrometry (LC-MS/MS) detection system, which is consisted of a nanoflow high-performance liquid chromatograph (HPLC) Easy nLC System (Thermo Fisher Scientific, San Jose, CA) coupled to an Orbitrap Fusion mass spectrometer (Thermo Fisher Scientific, San Jose, CA).

A total of 120-min gradient were employed to elute the equal ratio of 8-plex experiments (started from 2% to 5% buffer B within 5 min, then linearly increased to 25% buffer B within 110 min, 25% to 45% buffer B within 110 min, followed by raising buffer B to 90% within 4 min and holding for 2 min, returned back to 2% phase B within 1 min). Before DIA quantification, a comprehensive spectral library was constructed using DDA mode. For all DDA assays, fourier-transform ion cyclotron resonance (FTICR) full-scan was performed from m/z 350 to 1250 with automatic gain control (AGC) target of 1×10^6 and maximum injection time (IT) of 50 ms at a resolution of 15 K to identify peptides. Precursors were selected at top speed mode within cycle time of 3 s and subjected to dynamic exclusion of 20 s with a ± 0.01 m/z tolerance. The filtered precursors were triggered by high-energy collisional dissociation (HCD) MS/MS fragmentation using a 30% normalized collision energy (NCE), followed by scanning in Orbitrap with AGC target of 1×10^6 and an IT of 80 ms at 15000-resolving power to enlarge the scale of identified peptides/proteins. In contrast, the mdCATs DIA analysis had an additional quantitative resolving power (500 K at 200 m/z) performing after the survey scan with AGC target of 1×10^6 and maximum injection time (IT) of 100 ms. The assay used ten optimized discrete ranges in total: 350-576 m/z, 576-642 m/z, 642-693 m/z, 693-754 m/z, 754-805 m/z, 805-856 m/z, 856-907 m/z, 907-989 m/z, and 989-1250 m/z. For both DDA and DIA experiments the pre-filtration mode was enabled that only charge states from 2 to 5 could be eluted for MS/MS sampling. The data type was centroid.

Mass spectrometric acquisition of unequally mixed E. coli and human serum sample set: For the Easy nLC setup, 2 μ g of each mixed sample was reconstituted in buffer (98% H₂O, 2% ACN and 0.1% FA) and separated using one column setup with an Acclaim PepMap C18 2 μ m column of 75 μ m 250 mm dimensions (Thermo Scientific) on an EASY-nLC™ 1200 system (Thermo Scientific) connected to an Orbitrap Exploris™ 480 Mass Spectrometer (Thermo Scientific). The gradient of capillary flow LC-MS was set as follows: the flow rate was kept 300 nL/min through a 120 min segmented gradient (2%-30% buffer B to 100 min, 30%-50% buffer B from 100 min to 114 min, sharply increased to 100% buffer B within 1 min and held for 5 min). The DDA method consisted of MS1 scan from 350 to 1600 m/z at 120 K resolution with AGC target of 300 and cycle time of 1.7 s. Then, precursors with charge states 2- 6 were included and fragmented at 30% HCD. And the quadrupole isolation width was set to 1.6 m/z for DDA. Correspondingly, the DIA segments were setup with MS1 scan from 350 to 1600 m/z at 120 K resolution and triggered at 33 % HCD, followed by MS2 at 480 K resolution with AGC target of 200 and custom maximum injection time. As for the quantitative proteomes of multiple human liver serum samples, the discrete ranges were adjusted as follows: 350-526 m/z, 526-594 m/z, 594-646 m/z, 646-693 m/z, 693-746 m/z, 746-796 m/z, 796-848 m/z, 848-912 m/z, 912-998 m/z, and 998-1600 m/z. Either Orbitrap (FT) detectors of Orbitrap Exploris™ 480 Mass Spectrometer or Orbitrap Fusion mass spectrometer were calibrated by Pierce™ FlexMix™ Calibration Solution (ThermoFisher Scientific (San Jose, CA)). The electrospray voltage of 2.3 kV versus the inlet of the mass spectrometer was used. All DDA and DIA assays were performed alternatively to minimize errors.

Data Analysis

The acquired DDA MS raw files were processed using Proteome Discovery (PD, version 1.4.1.12, Thermo Electron Corp.) with the Mascot (version 2.3.0) nodes integrated, searching against a target-decoy database (Swissprot human database (released in January 2017; Homo sapiens, 20,129 entries) or the Swissprot E. coli database (released in June 2019; 3,607 entries, <http://www.uniprot.org/>). Searching parameters were set as follows: the lowest isotopic mdCAT tag (A2 (+382.2884 Da), which incorporated seven ¹³C, two ²H, and two ¹⁵N atoms) on peptide N-termini and lysine (K) residues, a 50 ppm precursor mass tolerance, a fragment mass tolerance of 0.5 Da, a maximum of two missing cleavages with trypsin enzyme, a validation with q-values to a false discovery rate (FDR) of 1% or less, and validation based on q-value. The comprehensive DDA spectral library was completely constructed by exporting files (.fasta) from PD. Then, Skyline (version 4.1, Seattle, WA) was used to extract targeted mass spectra from the each DIA.raw data, precursors with unknown or single charge were excluded for further search. Quantifications of b/y fragment

ions, Skyline script arguments included the following: a MS/MS filtration of predicted RT \pm 3min, a MS1 resolution of 120 K (60 K for equally mixed E. coli peptides), a MS2 resolution of 480 K (500 K for equally mixed E. coli peptides), the heaviest isotopic mdCAT (B2 (+382.3302 Da)) gauged as base, and the appropriate heavy isotopic mdCATs (the specific label schemed in Table 1, A1 (+382.3127 Da), A2 (+382.2884 Da), B1 (+382.2942 Da), C1 (+382.3010 Da), C2 (+382.3069 Da), D1 (+382.3185 Da), D2 (+382.3244 Da)). For all samples, oxidation of methionine residues (+15.9950 Da) and carbamidomethylation of cysteine residues (+57.0215 Da) were searched as variable and fixed modifications, respectively.

Quantification

After extracting fragments from the Skyline pre-established spectral library, the exported ion ratios were assigned to quantify corresponding peptides and the resolved pairs with ratio = 1 were required to drop to be eligible for peptides/protein quantification. Then, we employed an in-house programmed script to impute the missing value (< 50%) with K-Nearest Neighbors (KNN) on these peptides.^{2,3} Two peptides belonging to one protein were averaged to give the protein quantification ratio. Otherwise, quantitative protein measurements were acquired from the median ratios of all relative peptides. To assess the batch effects in our proteomic profiling quantifications, we implement Python V 3.7.3 to figure the hierarchical clustering and principal component analyses in terms of these two variables: batch identity and sample type (healthy individuals and liver cancer patients).

For gauging protein ratio boundaries of mdCAT DIA strategy, we equally mixed the pooled serum sample and processed the whole workflow in triplicate. Kolmogorov–Smirnov test was applied to conforming the normal distribution of protein data, of which outliers had been removed by box-plot statistical method. A confidence interval of 99% was established in the statistical subsequently model to obtain the up- and down-regulated boundaries.
