## Computational Details

All DFT calculations were carried out with the Gaussian 09 programs.<sup>1</sup> The geometries of all stationary points were fully optimized at the B3LYP<sup>2</sup> level in gas phase with SDD<sup>3</sup> basis set for Au atom and 6-31g (d) basis set for all other atoms. Vibrational frequencies were conducted at the same level of theory to verify all stationary points as local minima (zero imaginary frequencies) or first-order saddle points (one imaginary frequency) and the free energies were provided at 298.15 K. IRC<sup>4</sup> calculations have been also performed to ensure that all transition-state structures connected two relevant minima. The solvent effects of DCE were evaluated by single-point calculations employing a self-consistent reaction field (SCRF) method<sup>5</sup> with the PCM model<sup>6</sup> at the M06<sup>7</sup> level, in which the 6-311+g(d,p) basis set is used for the non-metallic atoms and SDD basis set for Au. To confirm the reliability of B3LYP//M06 method for describing the present system, we have implemented benchmark calculations for crucial selective-determining transition states, including **TS3-5** and **TS3-4** in Fig. S1, **TS3'-5'** and **TS3'-4'** in Fig. S3, and **TS15-16** and **TS15-20** in Fig. S2 by using PBE0,<sup>8</sup> WB97XD,<sup>9</sup> and M06-2X-D3<sup>10</sup> functionals with different basis sets, respectively. The computed energy differences for two selective-determining stationary points in three catalytic systems, **TS3-5 – TS3-4**, **TS3'-5' – TS3'-4'**, and **TS15-16 – TS15-20**, are displayed in Table S1 in the Supporting Information. All the functionals are found to give comparable energy differences and consistent trends.

These facts ensure the quality and accuracy of the B3LYP/M06 method used in the system under study.

<sup>a</sup> 6-31G (d, p) for C, H, O, and N atoms in the gas phase.

<sup>b</sup> 6-311+G(d, p) for C, H, O, and N atoms.

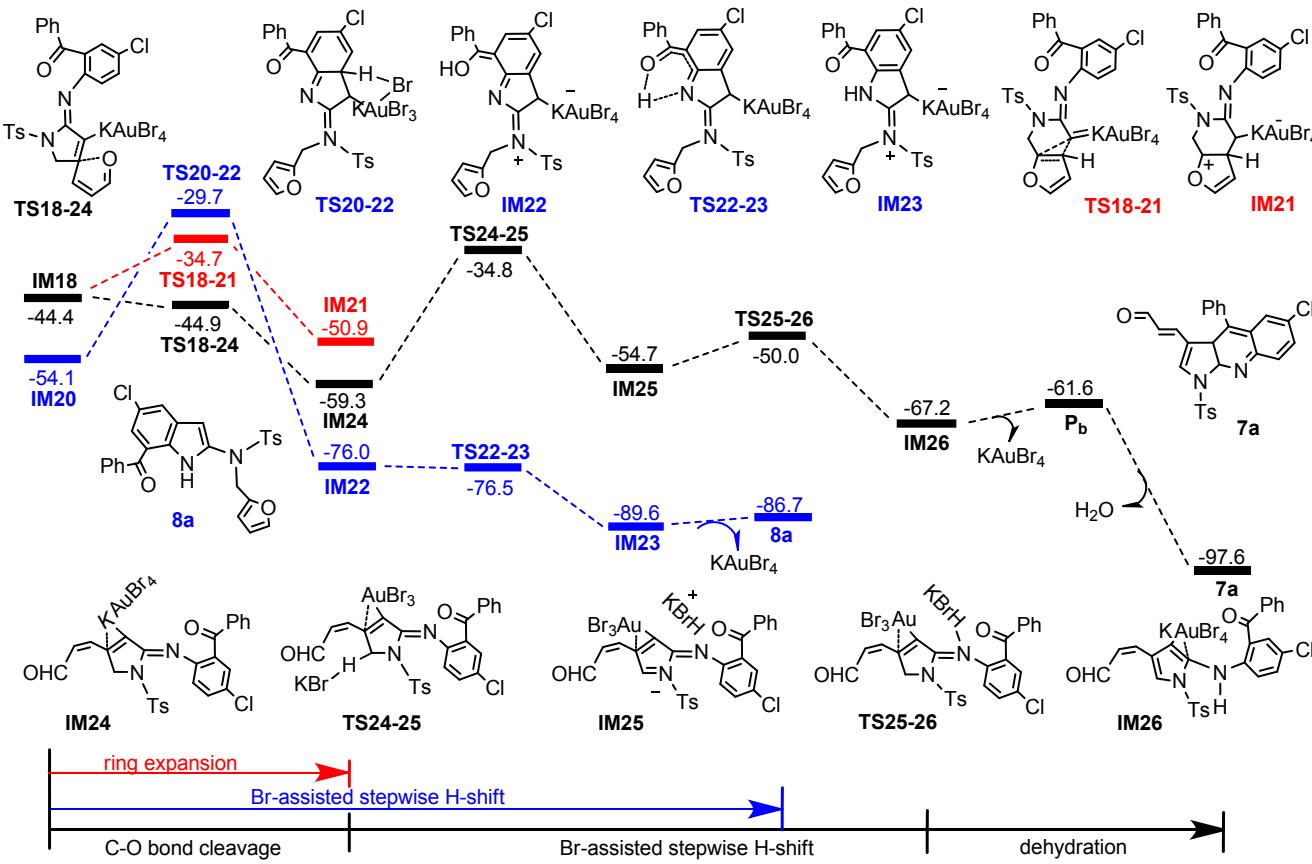

**Fig. S1** Optimized structures with selected structural parameters for key stationary points shown in Fig. 1. The bond distance and bond angle are given in Å and °, respectively.

**Fig. S2** Calculated free energy profile in DCE solvent for a-imino gold carbene electrophilic addition step along potential pathways in the **1a**-system. The relative free energies are given in kcal mol<sup>-1</sup>.

For the **1a** system, starting from **IM3**, the reaction can possibly undergo either direct C<sup>t</sup>-nucleophilic attack via **TS3-4** or Br-migration (**TS3-5**) followed by O-nucleophilic substitution (**TS5-6**). The two selective-determining transition states, **TS3-4** and **TS5-6** are found to be energetically comparable (-8.3 and -8.0 kcal mol<sup>-1</sup>), both of which, however, are less stable in energy than **TS3-5** in Fig. 1 (-11.5 kcal mol<sup>-1</sup>). Therefore, these two competitive pathways are theoretically ruled out. (Fig. S2)

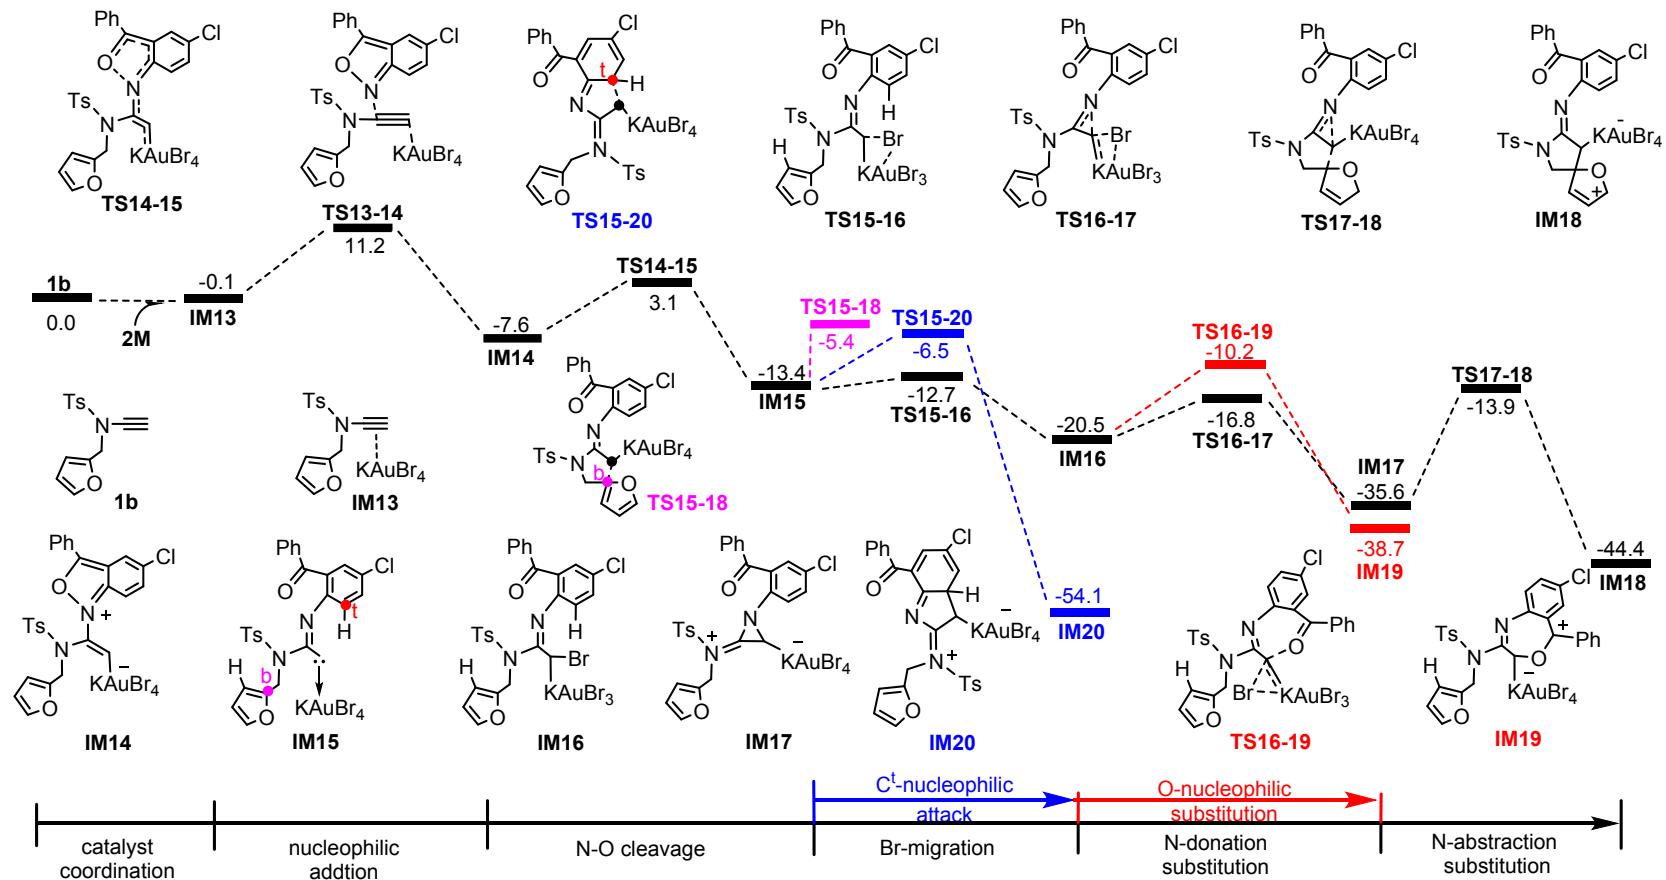

**Fig. S3** Calculated free energy profiles in DCE solvent for possible pathways starting from **IM18** and **IM20**, respectively (**1b**-system). The relative free energies are given in kcal mol<sup>-1</sup>.

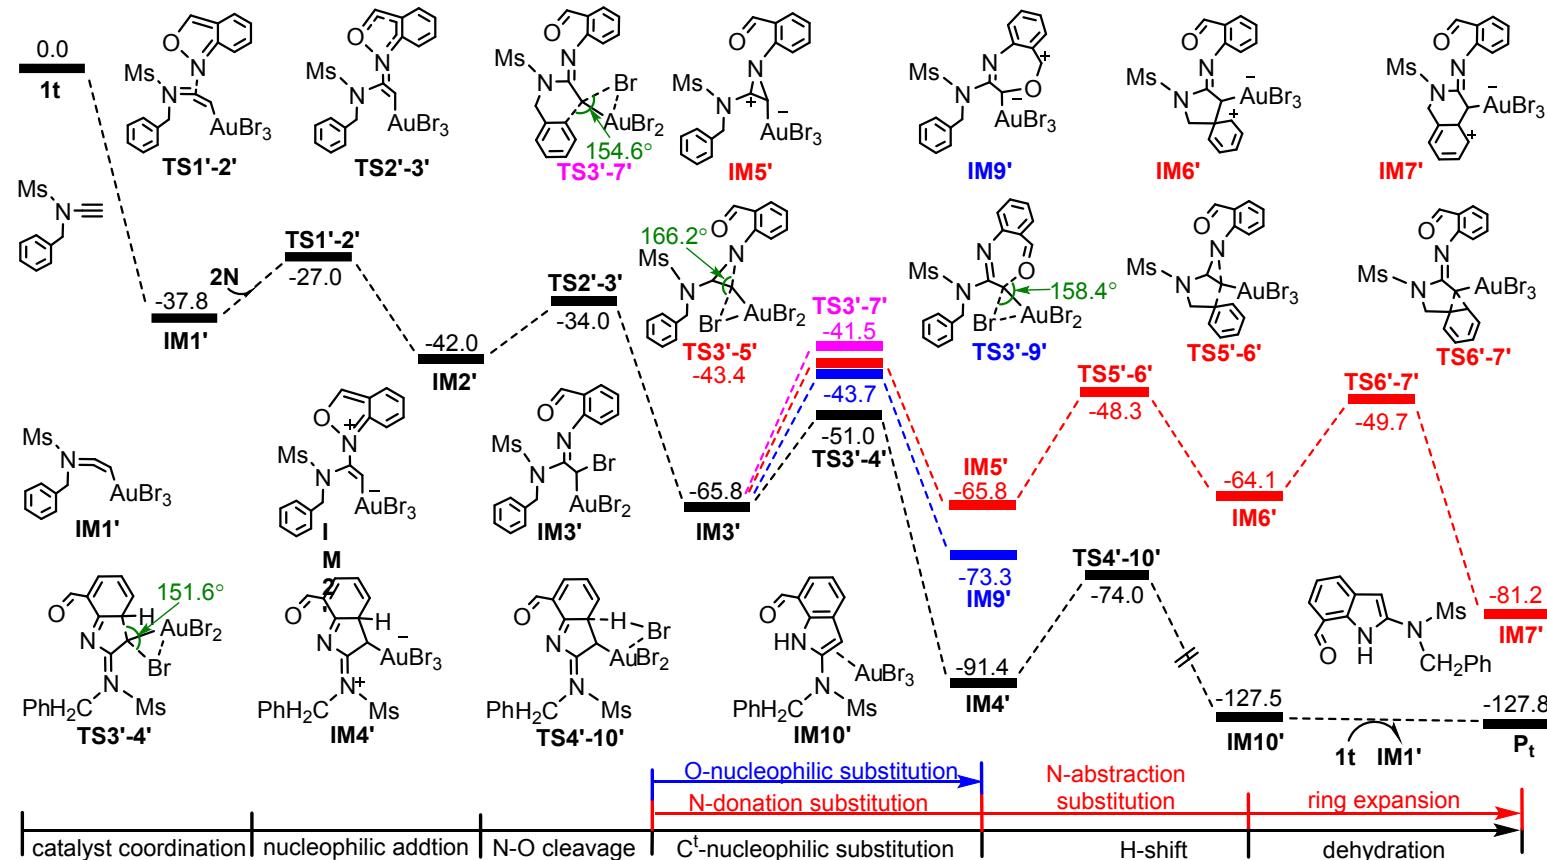

For the **1b** annulation, from **IM18**, the alternative ring expansion through C(Au)-migration (**TS18-21**, Fig.S3) was also explored and found to be energetically disfavored over C<sup>b</sup>-O cleavage via **TS18-24** (-34.7 vs -44.9 kcal mol<sup>-1</sup>). The calculated NBO charges demonstrate that the stronger electrostatic attraction involved in **TS18-24** facilitates the C<sup>b</sup>-O bond rupture, thereby producing a relatively lower energy requirement. (Fig. S3)

In addition, after C<sup>t</sup>-nucleophilic attack of **IM15** to give **IM20** (blue line, Fig. S4), the stepwise Br-assisted H-shift is possibly followed, from which the 7-acylindole product **8a** is obtained, and simultaneously, KAuBr<sub>4</sub> is regenerated (Fig. S3). Unfortunately, the Br-assisted H-abstraction process via **TS20-22** is 15.2 kcal mol<sup>-1</sup> higher as compared to C<sup>b</sup>-O cleavage (**TS18-24**, black line). Consequently, the alternative C<sup>t</sup>-nucleophilic attack pathway is kinetically unfavoured (Fig. S3).

For the **1b** system, we also examined the direct C<sup>b</sup>- and C<sup>t</sup>-nucleophilic attack of **IM15** (pink- and blue- line, respectively), as well as the nucleophilic substitution of the carbonyl O atom from **IM16** (red line), all of which are computed to be unfavorable over the pathway along Br-migration → N-donation/abstraction substitution (black line) due to higher energy demands involved (Fig. S4)

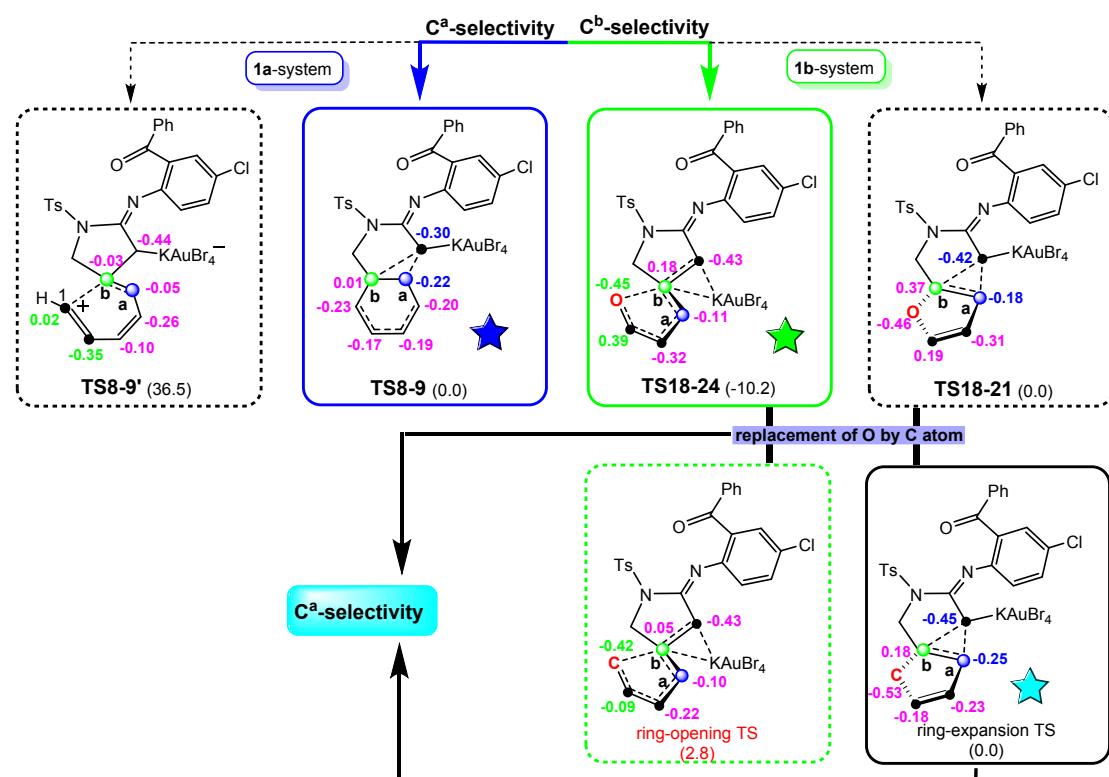

**Fig. S4** Calculated free energy profiles in DCE solvent for all possible pathways from the KAuBr<sub>3</sub>-catalyzed annulation reaction of **1b** with **2M** (1b-system). The relative free energies are given in kcal mol<sup>-1</sup>.

**Fig. S5** Calculated free energy profiles in DCE solvent for all possible pathways from  $\text{AuBr}_3$ -catalyzed annulation of **1t** and **2b** (**1t**-system). The relative free energies are given in kcal mol<sup>-1</sup> and the bond angles are given in °.

Similar to the **1a** system, for the **1t** system, a series of the possible pathways from **IM3'**—the N-donation substitution via **TS3'-5'** (-43.4 kcal mol<sup>-1</sup>), the C<sup>a</sup>-nucleophilic substitution via **TS3'-7'** (-41.5 kcal mol<sup>-1</sup>), and the O nucleophilic substitution via **TS3'-9'** (-43.7 kcal mol<sup>-1</sup>)—are examined and compared with the C<sup>t</sup>-nucleophilic substitution via **TS3'-4'** (-51.0 kcal mol<sup>-1</sup>). Clearly, in all these transition states, **TS3'-4'** exhibits the highest stability, which is predicted to be related to the weakest Br *trans*-influence involved with the Br-C(Au)-C<sup>t</sup> bond angle of 151.6°. In comparison, the Br-C(Au)-N bond angle in **TS3'-5'**, Br-C(Au)-C<sup>a</sup> bond angle in **TS3'-7'** and Br-C(Au)-O bond angle in **TS3'-9'** are 166.2°, 154.6° and 158.4°, respectively. As a result, the smallest *trans*-influence in **TS3'-4'** renders the C<sup>t</sup> attack the easiest (Fig. S5).

**Fig. S6** Calculated NBO charges (in e) for ring-opening transition state and ring-expansion transition states in **1a**-, **1b**-systems, and the system with the replacement of O by C atom. The relative free energies are given in kcal mol<sup>-1</sup>.

**Table S2** Calculated Gibbs free energies in the gas-phase using B3LYP functional, single-point HF energies in DCM solvent using M06 functional, and imaginary frequencies for all structures in the present work. The relative energies and the imaginary frequencies are given in Hartree and cm<sup>-1</sup>, respectively.
