## Materials and methods

All reactants were purchased from Sigma Aldrich. 2,5-dihydroxy-3,6-di-tert-butyl-pbenzoquinone was synthesized according to the previously reported procedure [1]. All synthetic manipulations were performed under Schlenk line conditions. Solvents were purified by standard methods [2]. Elemental analyses were performed with an Elementar Vario El cube instrument. Electronic absorption (UV-vis) spectra in range 200-900 nm of nujol mulls were recorded on a Carl Zeiss Jena Specord M400 spectrophotometer. IR-spectra of studied compounds were recorded on a FSM1201 Fourier-IR spectrometer in a nujol using KBr plates in the range 4000$400 \mathrm{~cm}^{-1}$.

The magnetic susceptibility of the polycrystalline complexes was measured with a Quantum Design MPMSXL SQUID magnetometer in the temperature range 2-300 K with magnetic field of up to 5 kOe . None of complexes exhibited any field dependence of molar magnetization at low temperatures. Diamagnetic corrections were made using the Pascal constants. The effective magnetic moment was calculated as $\mu_{\text {eff }}(T)=\left[\left(3 \mathrm{k} / \mathrm{N}_{\mathrm{A}} \mu_{\mathrm{B}}{ }^{2}\right) \chi T\right]^{1 / 2} \approx$ $(8 \chi T)^{1 / 2}$.

The X-ray data for were collected on an Agilent Xcalibur E diffractometer ( $\mathrm{MoK}_{\alpha}$ radiation, $\omega$-scans technique, $\lambda=0.71073 \AA, T=100 \mathrm{~K}$ ) using and CrysAlisPro [3] software packages. The structures were solved by dual methods and were refined by full-matrix least squares on $F^{2}$ for all data using SHELXTL package [4]. Analytical numeric absorption correction using a multifaceted crystal model based on expressions derived by R.C. Clark \& J.S. Reid [5] was used. All non-hydrogen atoms were found from Fourier syntheses of electron density and were refined anisotropically. Hydrogen atoms were placed in calculated positions and were refined in the "riding" model with $U(H)_{\text {iso }}=1.2 U_{e q}$ of their parent atoms $\left(U(H)_{\text {iso }}=1.5 U_{e q}\right.$ for methyl groups). CCDC - 2005205-2005207 (1-3) contains the supplementary crystallographic data for this paper. These data are provided free of charge by The Cambridge Crystallographic Data Centre: ccdc.cam.ac.uk/structures. The crystallographic data and structure refinement details for 1-3 are given in ESI in Table S1.

An analysis of the porous structure was performed by a carbon dioxide adsorption technique using Quantochrome's Autosorb iQ at 195 K. Cryostat CryoCooler was used to adjust temperature with 0.05 K accuracy. Carbon dioxide adsorption-desorption isotherms were measured within the range of relative pressures from $10^{-3}$ till 0.995 . The specific surface area
was calculated from the data obtained on the basis of the conventional BET, Langmuir and DFT models. Pore size distributions were calculated using DFT method. The database of the National Institute of Standards and Technology [6] was used as a source of $\mathrm{p}-\mathrm{V}-\mathrm{T}$ relations at experimental pressures and temperatures.

Electrochemical measurements were performed on a BASiEpsilonE2P electrochemical analyzer (USA). The program handles wave Epsilon-EC-USB-V200. A conventional threeelectrode system was used with glassy carbon for solutions or carbon paste electrode (CPE) for powder samples as the working electrode, the $\mathrm{Ag} / \mathrm{AgC1}(0.01 \mathrm{M})$ electrode as the reference electrode and a Pt wire as the counter electrode. $0.1 \mathrm{M} \mathrm{Et}_{4} \mathrm{NBF}_{4}$ was used as the supporting electrolyte for the determination of current-voltage characteristics. Acetonitrile was distilled over $\mathrm{P}_{2} 0_{5}$ and $\mathrm{KMnO}_{4}$, and then over molecular sieves. After purification, the solvent was stored under dry argon. Used as a base salt, $\mathrm{Et}_{4} \mathrm{NBF}_{4}$ was recrystallized from ethanol and dried in a vacuum chamber at $100{ }^{\circ} \mathrm{C}$ for 2 days. To study powder samples, a modified CPE working electrode was used. Its preparation was as follows: the carbon particles/ phosphonium salt (dodecyl(tri-tert-butyl)phosphonium tetrafluoroborate) composite electrode was prepared by grinding a mixture of graphite powder and phosphonium salt in a ratio of 90/10 (w/w) in a mortar to give the homogeneous mass [7-10]. A modified electrode was made in a similar manner except that a part (ca. 5\%) of graphite powder was replaced by the complex under investigation. A portion of the resulting paste was packed firmly into the cavity ( 3 mm in diameter) of a Teflon holder.

X-ray powder diffraction measurements were performed on Shimadzu LabX XRD-6100 X-ray Powder Diffractometer.

## Experimental details.

Synthesis of 1. A mixture of solid $\mathrm{LaCl}_{3} \cdot 7 \mathrm{H}_{2} \mathrm{O}(37 \mathrm{mg}, 0.1 \mathrm{mmol})$ and $\mathrm{H}_{2} \mathrm{pQ}(25 \mathrm{mg}, 0.1$ mmol ) were placed in a glass ampoule and $\mathrm{N}, \mathrm{N}$ '-dimethylacetamide ( 5 mL ) was added. Ampoule was evacuated, sealed and heated at $130^{\circ} \mathrm{C}$ for 1 day. The obtained burgundy crystals were separated by the filtration, washed twice by 5 ml of $\mathrm{N}, \mathrm{N}$ '-dimethylacetamide and dried on air.

Yield 0.34 mg ( 74 \%). $\mathrm{C}_{58} \mathrm{H}_{90} \mathrm{La}_{2} \mathrm{~N}_{4} \mathrm{O}_{16}$. Calculated C, 50.58 ; H, 6.59; N 4.07 \%. Found C, 50.72; H, 6.67; N 3.96 \%. IR (Nujol, KBr) cm ${ }^{-1}$ : 1640(w), 1615(w), 1590(m), 1535(w), 1339(w), $1268(\mathrm{~m}), 1212(\mathrm{~m}), 1200(\mathrm{~m}), 1051(\mathrm{~m}), 1033(\mathrm{~m}), 1022(\mathrm{~m}), 969(\mathrm{~m}), 924(\mathrm{~s}), 900(\mathrm{~m}), 797(\mathrm{~m})$, 744(m), 656(w), 624(s), 595(w), 480(w).

Synthesis of 2. Synthesis was performed according to the procedure for complex 1 with $\mathrm{PrCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(36 \mathrm{mg}, 0.1 \mathrm{mmol})$.

Yield $0.30 \mathrm{mg}(65 \%) . \mathrm{C}_{58} \mathrm{H}_{90} \mathrm{Pr}_{2} \mathrm{~N}_{4} \mathrm{O}_{16}$. Calculated C, 50.44; H, 6.57; N 4.06 \%. Found C, 50.79; H, 6.65; N 3.94 \%. IR (Nujol, KBr) cm ${ }^{-1}$ : 1639(w), 1613(w), 1591(m), 1538(w), 1338(w), 1265(m), 1212(m), 1198(m), 1050(m), 1034(m), 1021(m), 969(m), 922(s), 899(m), 794(m), 745(m), 657(w), 625(s), 596(w), 484(w).

Synthesis of 3. Synthesis was performed according to the procedure for complex 1 with $\mathrm{NdCl}_{3} \cdot 6 \mathrm{H}_{2} \mathrm{O}(36 \mathrm{mg}, 0.1 \mathrm{mmol})$.
Yield 0.37 mg ( $80 \%$ ). $\mathrm{C}_{58} \mathrm{H}_{90} \mathrm{Nd}_{2} \mathrm{~N}_{4} \mathrm{O}_{16}$. Calculated C, 50.19 ; H, 6.54; N 4.04 \%. Found C, 50.51 ; H, 6.83; N 3.89 \%. IR (Nujol, KBr) cm ${ }^{-1}$ : 1642(w), 1614(w), 1591(m), 1540(w), 1340(w), 1266(m), 1212(m), 1197(m), 1052(m), 1038(m), 1020(m), 970(m), 923(s), 900(m), 794(m), 753(m), 656(w), 623(s), 596(w), 486(w).

## Table S1. Crystal data and structure refinement for 1-3.
