Supplementary information

Content:

Table S1 – List of all compounds with the 2D diagram tested with NVP to form multicomponents, grouping in G1 (green), G2 (yellow) and G3 (red). Ranking positions obtained through the techniques used for all of them are shown. Each group has been sorted by the consensus C score.

Table S2 – Experimental methods used in the trials to form NVP multicomponents for compounds in the groups G2 and G3. A description of each method is given below.

Table S3 – H-Bond Propensity results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by HBP ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; ^{CSD} means molecules reported in the CSD database. Red-underline letter identify the negative results.

Table S4 – Coordination value results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by CV ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; ^{CSD} means molecules reported in the CSD database. Red-underline letter identify the negative results.

Table S5 – Molecular complementarity results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by MC ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; ^{CSD} means molecules reported in the CSD database. Red-underline letter identify the negative results.

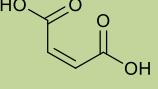

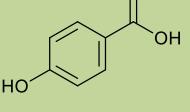

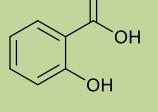

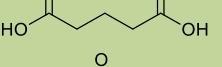

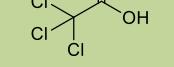

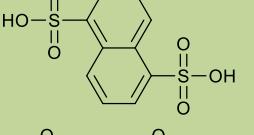

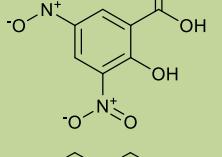

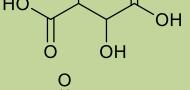

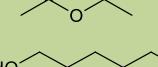

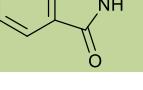

Table S56 – COSMOQuick results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by COSMO ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; ^{CSD} means molecules reported in the CSD database. Red-underline letter identify the negative results.

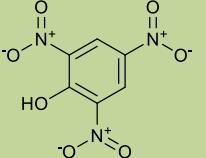

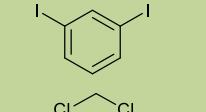

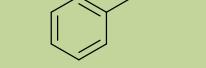

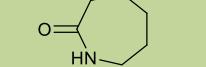

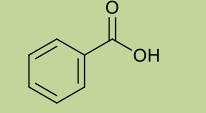

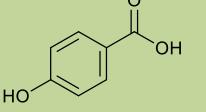

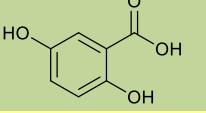

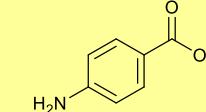

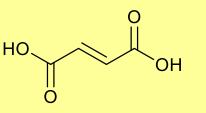

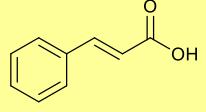

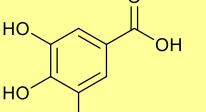

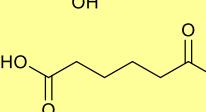

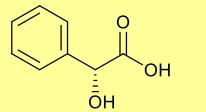

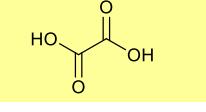

Table S7 – Scores and Ranking obtained for CV, MC, HBP, COSMOQuick and the three consensus ranking A, B and C for the multicomponent analysis of 450 co-formers against NVP molecule. The co-formers were ordered by the consensus ranking C, obtained from the sum of ranking positions obtained for MC, HBP analysis, and CosmoQuick prediction. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; ^{CSD} means molecules reported in the CSD database. Red-underline letter identify the negative results.

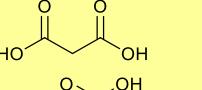

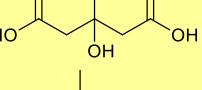

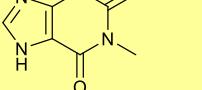

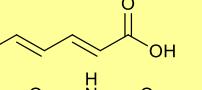

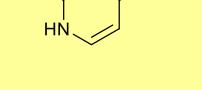

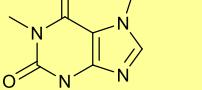

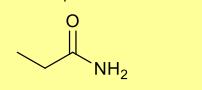

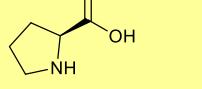

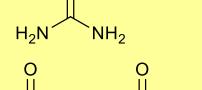

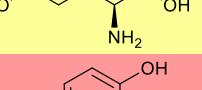

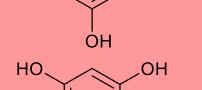

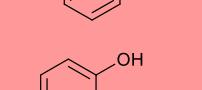

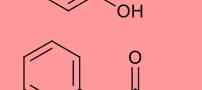

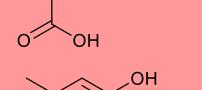

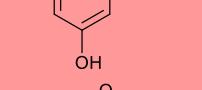

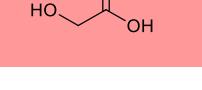

Table S8 – Distribution of some frequent chemical groups in the database of 450 structures used in the theoretical screening and in the 76 molecules tested to form multicomponent with NVP.

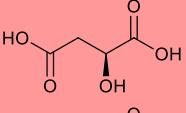

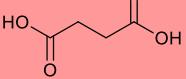

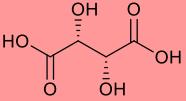

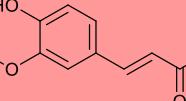

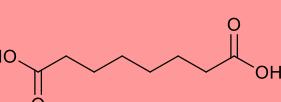

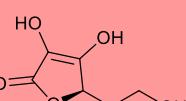

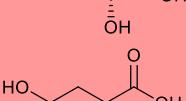

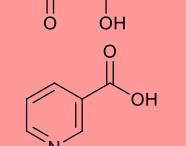

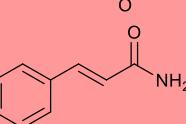

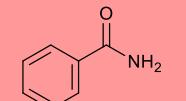

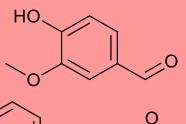

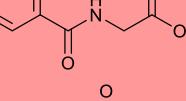

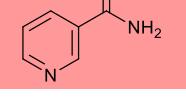

Figure S1 –ROC curves and AUC values obtained for each method: CV, MC, HBP, COSMOQuick, and the three consensus A, B and C.

Table S1 – List of all compounds with the 2D diagram tested with NVP to form multicomponents, grouping in G1 (green), G2 (yellow) and G3 (red). Ranking positions obtained through the techniques used for all of them are shown. Each group has been sorted by the consensus C score.

Table S2 – Experimental methods used in the trials to form NVP multicomponents for compounds in the groups G2 and G3. A description of each method is given below.

Co-formers	Experimental techniques used
G2	
4-Aminobenzoic acid	LAG method using magnetic stirrer. LAG method using manual grinding. ¹ Nalte et al. has obtained the co-crystal by using the neat grinding method.
Fumaric acid	LAG method using magnetic stirrer. ² Caira et al. has employed dry co-grinding and LAG methods, and obtained the co-crystal.
Cinnamic acid	¹ Nalte et al. has obtained the co-crystal by using the neat grinding method.
Gallic acid	LAG method applying high energy. ¹ Nalte et al. has obtained the co-crystal by using the neat grinding method.

Adipic acid	LAG method using magnetic stirrer. LAG method using manual grinding. ² Caira et al. has obtained the co-crystal by using the LAG method.
L-Mandelic acid	¹ Nalte et al. has obtained the co-crystal by using the neat grinding method.
Oxalic acid	LAG method applying high energy. LAG method applying low energy. LAG method using magnetic stirrer. LAG method using manual grinding. ³ Gujar et al. has obtained the co-crystal by using the solution crystallization method, dissolving equimolar quantities of NVP and oxalic acid in acetone. ¹ Nalte et al. has obtained the co-crystal by using the neat grinding method. ² Caira et al. has employed slow evaporation, neat grinding, solvent-drop grinding, and LAG methods.
Malonic acid	LAG method using magnetic stirrer. LAG method using manual grinding. ¹ Nalte et al. has obtained the co-crystal by using the neat grinding method. ² Caira et al. has employed LAG method.
Citric acid	LAG method applying high energy. LAG method applying low energy. LAG method using manual grinding. ¹ Nalte et al. has obtained the co-crystal by using the neat grinding method. ² Caira et al. has employed slow-evaporation and solvent-drop grinding methods.
Theophylline	LAG method applying low energy. An eutectic was obtained.
Sorbic acid	² Caira et al. obtained the co-crystal by using dry co-grinding and LAG methods.
Uracil	² Caira et al. has obtained the co-crystal by using the LAG method.
Caffeine	LAG method applying low energy. An eutectic was obtained.
Propionamide	² Caira et al. has obtained the co-crystal by using the LAG method.
L-Proline	² Caira et al. has obtained the co-crystal by using the LAG method.
Urea	LAG method applying low energy. LAG method using manual grinding. ¹ Nalte et al. has obtained the co-crystal by using the neat grinding method.
Glutamic acid	LAG method using manual grinding. ² Caira et al. has obtained the co-crystal by using dry co-grinding and LAG methods.
G3	
Hydroquinone	LAG method applying high energy.
Phloroglucinol	LAG method applying high energy.
Resorcinol	LAG method applying high energy.
Catechol	LAG method applying high energy.
Acetylsalicylic acid	LAG method using magnetic stirrer. LAG method using manual grinding.
Orcinol	LAG method applying high energy.
Glycolic acid	LAG method using manual grinding.
L-Malic acid	LAG method applying low energy. ² Caira et al. has employed dry co-grinding and LAG methods.
Succinic acid	LAG method using magnetic stirrer. ² Caira et al. has employed slow-evaporation, neat grinding, solvent-drop grinding, and LAG methods.
L-Tartaric acid	LAG method using magnetic stirrer. LAG method using manual grinding. ¹ Nalte et al. has employed the neat grinding method. ² Caira et al. has employed slow-evaporation, neat grinding, solvent-drop grinding and LAG methods.
Ferulic acid	¹ Nalte et al. has employed the neat grinding method.
Suberic acid	² Caira et al. has employed the LAG method.
L-Ascorbic acid	LAG method using magnetic stirrer. ² Caira et al. has employed the LAG method.

DL-Malic acid	LAG method using magnetic stirrer. LAG method using manual grinding.
Nicotinic acid	LAG method using magnetic stirrer. LAG method using manual grinding. ² Caira et al. has employed the LAG method.
Stearic acid	² Caira et al. has employed slow-evaporation, neat grinding, and solvent-drop grinding methods.
Orotic acid	² Caira et al. has employed the LAG method.
Cinnamamide	² Caira et al. has employed the LAG method.
Benzamide	LAG method using manual grinding. ² Caira et al. has employed the LAG method.
Vanillin	LAG method using manual grinding.
Hippuric acid	LAG method using magnetic stirrer. LAG method using manual grinding. ¹ Nalte et al. has employed the neat grinding method. ² Caira et al. has employed the LAG method.
Nicotinamide	LAG method using manual grinding. ² Caira et al. has employed slow-evaporation, neat grinding, solvent-drop grinding, and LAG methods.
Theobromine	LAG method applying low energy.
Isonicotinamide	LAG method using manual grinding. ² Caira et al. has employed slow-evaporation, neat grinding, solvent-drop grinding, and LAG methods.
Piperazine	² Caira et al. has employed the LAG method.
L-Arginine	LAG method using manual grinding. ² Caira et al. has employed the LAG method.
Pyroglutamic acid	² Caira et al. has employed the LAG method.
Succinamide	² Caira et al. has employed the LAG method.
L-Aspartic acid	LAG method using manual grinding. ² Caira et al. has employed slow-evaporation and solvent-drop grinding methods.
DL-Aspartic acid	² Caira et al. has employed slow-evaporation and solvent-drop grinding methods.
Glycine	² Caira et al. has employed the LAG method.
L-Alanine	LAG method using manual grinding.
L-Valine	² Caira et al. has employed the LAG method.
L-Glutamine	LAG method using manual grinding.

Techniques that we have used for the liquid assisted grinding (LAG):

- 1) **LAG method applying high energy:** By using the mixer mill MM200 (Retsch), 150 mg of stoichiometric (1:1) amounts of NVP and coformer were ground in the presence of 4 or 5 drops of chloroform. The sample mixture and the solvent were placed in an agate jar with two steel balls ($\Phi = 5$ mm) and maintained under 25 Hz of vibrational frequency, during 30 minutes, and at room temperature. The solvent was evaporated at room temperature.
- 2) **LAG method applying low energy:** 3 mmol of NVP and 3 mmol of coformer were ground in the presence of 1000 μ L of chloroform. The sample mixture and the solvent were placed in a glass tube with 4 steel balls ($\Phi = 5$ mm) and 8 steel balls ($\Phi = 3$ mm). The glass tubes were mounted in a system using a PVC tube and polystyrene foam to keep the tubes immobilized. The system (PVC tube + polystyrene foam + tubes) was put in a roller mill and it was maintained under rotation frequency of 270 rpm, during 24 hours, and at room temperature. The solvent was evaporated at room temperature.
- 3) **LAG method using magnetic stirrer:** 0.3 mmol of NVP and 0.3 mmol of coformer were ground in the presence of 300 μ L of solvent (acetone or chloroform). The sample mixture and the solvent were placed in a glass tube with a magnetic bar. The system was let under agitation in a magnetic stirrer, at low agitation, during 2 hours, and at room temperature. The solvent was evaporated at room temperature.
- 4) **LAG method using manual grinding:** 150 mg of stoichiometric (1:1) amounts of NVP and coformer were manually ground in the presence of 4 or 5 drops of chloroform in an agate mortar.

Techniques used by other authors:

- 5) ¹Nalte et al. has applied the **neat grinding method**. Stoichiometric ratios of NVP and co-former were ground in a mortar pestle by manual grinding during 20 minutes.
- 6) ²Caira et al. has employed a series of experiments using different methods:
 - a. **Slow-evaporation method** using stoichiometric ratios (1:1 and 1:2) and various solvents.
 - b. **Neat-grinding (manual grinding)** method using NVP-co-former stoichiometric ratios 1:1 and 2:1.
 - c. **Solvent-drop grinding (manual grinding)** method using NVP-co-former stoichiometric ratios 1:1 and 2:1, and different solvents.
 - d. **Dry co-grinding** method using 1:1 stoichiometric ratio.
 - e. **Liquid-assisted grinding (LAG)** method using various solvents and different stoichiometric ratios (1:1, 2:1, and 1:3).
- 7) ³Gujar et al. has applied the **solution crystallization method**. Equimolar quantities of NVP and co-former were dissolved in 110 ml of acetone and were kept in a warm bath (40 °C). After, the solution was let to crystallize for 1 hour.

Table S4 – Coordination value results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by CV ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; CSD means molecules reported in the CSD database. Red-underlined letter identify the negative results.

Co-former	Molecular formula	CV score	CV ranking

**Toluene does not exhibit donor or acceptor groups. Thus, the CV score value obtained reflects only the CV for NVP molecule.

Table S5—Molecular complementarity results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by MC ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; CSD means molecules reported in the CSD database. Red-underlined letter identify the negative results.

Table S6 – COSMOQuick results for a multicomponent analysis of 450 co-formers against NVP molecule. Molecules are ordered by COSMO ranking position. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; CSD means molecules reported in the CSD database. Red-underlined letter identify the negative results.

Table S7 – Scores and Ranking obtained for CV, MC, HBP, COSMOQuick and the three consensus ranking A, B and C for the multicomponent analysis of 450 co-formers against NVP molecule. The co-formers were ordered by the consensus ranking C, obtained from the sum of ranking positions obtained for MC, HBP analysis, and CosmoQuick prediction. In bold are represented the 76 molecules for which experimental multicomponent results are available. Black-italic letter identify the positive results; CSD means molecules reported in the CSD database. Red-underlined letter identify the negative results.

Co-former	Molecular formula	CV score	CV ranking	MC score	MC ranking	HBP score	HBP ranking	Consensus A	Consensus Ranking A	f_{fit}	H_{ex} (kcal.mol ⁻¹)	COSMOQuick ranking	Consensus B	Consensus ranking B	Consensus C	Consensus ranking C
