#### Salt diffusion coefficients

The salt diffusion coefficients ( $^{D}$ salt) were measured according to past literature.<sup>1</sup> The experiments were performed using the Li symmetric cells prepared in the same way as for the potentiostatic polarisation method, for measuring the Li<sup>+</sup> transference number  $t_{Li}^{PP}$ . First, the cell was polarised to 10 mV in potentiostatic mode. After the cell reached the steady state, it was relaxed until the potential returned to its initial value (i.e., the value before polarisation). Here, the potential relaxation plots (U(t)) were fitted to Eq. S1 in order to calculate the salt diffusion coefficient within a porous separator ( $^{D}$ s).

$$U(t) = V_0 + ae^{-bt} \# (Eq.S1)$$

 $V_0$  is the offset potential; *a* and *b* are the fitting parameters; and  $D_S$  was calculated using the following equation (Eq. S2).

$$D_S = \frac{L^2 b}{\pi^2} \#(Eq.S2)$$

where L is the thickness of the separator. For the calculation of Onsager coefficients, the salt diffusion coefficients within separator-free electrolytes ( $D_{salt}$ ) should be used. Here,  $D_{salt}$  was obtained by correcting the salt diffusion coefficients within the separator with the tortuosity,  $\tau$ , of the separator, which is estimated from conductivity data and separator porosity (0,88), as follows:

$$D_{Salt} = \tau D_S \# (Eq.S3)$$

## **Calculation of Onsager transport coefficients**

Based on the Onsager reciprocal relations, the ionic conductivity  $\sigma_{ion}$  is described as shown below.<sup>2,3</sup>  $\sigma_{ion} = \sigma_{++} + \sigma_{--} - 2\sigma_{+-} \#(Eq.S4)$  Here, three Onsager coefficients ( $^{\sigma}$  ++ ,  $^{\sigma}$  -- and  $^{\sigma}$  +- ) can be calculated from four parameters ( $^{A_{1}}$  --  $^{A_{4}}$ ) which are defined by the experimentally obtained quantities,  $\sigma_{ion}$ ,  $t_{Li}^{PP}$ ,  $D_{salt}$  and  $d\Delta \varphi/dln(c)$  <sup>26</sup>.

$$A_1 \equiv \sigma_{ion} = \sigma_{++} + \sigma_{--} - 2\sigma_{+-} #(Eq.S5)$$

$$A_{2} \equiv \sigma_{ion} \cdot t_{Li}^{PP} = \sigma_{++} - \frac{(\sigma_{++})^{2}}{\sigma_{--}} \# (Eq.S6)$$

$$A_{3} \equiv \frac{D_{salt} \cdot \sigma_{ion} \cdot c \cdot F^{2}}{2RT} = \left\{ \sigma_{++} \cdot \sigma_{--} - \left(\sigma_{+-}\right)^{2} \right\} \cdot \frac{dln(a_{\pm})}{dln(c)} \# (Eq.S7)$$
$$A_{4} \equiv \frac{d\Delta\varphi}{dln(c)} \cdot \frac{F^{2}}{2RT} \cdot \sigma_{ion} = \left(\sigma_{--} - \sigma_{+-}\right) \cdot \frac{dln(a_{\pm})}{dln(c)} \# (Eq.S8)$$

Three Onsager coefficients are obtained by solving the above four equations (Eq. S5 ~ Eq. S8).

$$\sigma_{++} = \frac{1}{A_2^2 A_4^2} \cdot \left(A_1 A_2^2 A_4^2 - 2A_1 A_2 A_3 A_4 + A_1 A_3^2 + 2A_2^2 A_3 A_4 - A_2 A_3^2\right) \#(Eq.S9)$$
  
$$\sigma_{--} = \frac{A_3^2 \cdot (A_1 - A_2)}{A_2^2 A_4^2} \#(Eq.S10)$$
  
$$\sigma_{+-} = \frac{1}{A_2^2 A_4^2} \cdot \left(-A_1 A_2 A_3 A_4 + A_1 A_3^2 + A_2^2 A_3 A_4 - A_2 A_3^2\right) \#(Eq.S11)$$

The two Onsager coefficients,  $\sigma_{++}$  and  $\sigma_{--}$ , are split into the self-terms and the distinct terms:

$$\sigma_{ion} = \sigma_{+}^{self} + \sigma_{++}^{distinct} + \sigma_{--}^{self} + \sigma_{--}^{distinct} - 2\sigma_{+-} \#(Eq.S12)$$

The self-terms,  $\sigma^{self}_{+}$  and  $\sigma^{self}_{-}$ , are derived from the Nernst–Einstein equation by inserting the experimentally obtained diffusivity data,  $D_{Li}$  and  $D_{anion}$ .

$$\sigma_{+}^{self} = \frac{cF^2D_{Li}}{RT}, \ \sigma_{-}^{self} = \frac{cF^2D_{anion}}{RT} \# (Eq.S13)$$

The distinct terms can be calculated by simply subtracting  $\sigma^{self}_{+}$  (and  $\sigma^{-}_{-}$ ) from  $\sigma_{++}$  (and  $\sigma_{--}$ ).

**Figure S1.** Plots of the Li/Li<sup>+</sup> electrode potential against natural logarithm of the Li salt concentration in mixture of LiTFSA in the solvents at 30 °C. The reference electrode was Li/Li<sup>+</sup> in 1 mol dm<sup>-3</sup> Li[TFSA]/G3.

## Numerical data

**Table S1.** Six experimentally obtained parameters for the calculation of Onsager transport coefficients.  $\sigma_{ion}$ ,  $D_{Li}$ , and  $D_{TFSA}$ , of [Li(G3)][TFSA], [Li(G1)<sub>2</sub>][TFSA] and [Li(G4)][TFSA] are obtained from ref. 16.  $\sigma_{ion}$ ,  $D_{Li}$ , and  $D_{TFSA}$ , of [Li(SL)<sub>2</sub>][TFSA] and [Li(SL)<sub>3</sub>][TFSA] are obtained from ref. 18.

Sample	$\sigma_{ion}$ [mS cm <sup>-1</sup> ]	$t_{Li}^{PP}$	$D_{Li}$ [10 <sup>-7</sup> cm <sup>2</sup> s <sup>-1</sup> ]	$D_{TFSA}$ [10 <sup>-7</sup> cm <sup>2</sup> s <sup>-1</sup> ]	$D_{salt}$ [10 <sup>-7</sup> cm <sup>2</sup> s <sup>-1</sup> ]	$rac{d\Delta arphi}{dln(c)}$
[Li(G3)][TFSA]	1.1	0.028	0.77	0.54	0.53	0.78
[Li(G4)][TFSA]	1.6	0.028	1.26	1.22	0.69	0.65
[Li(G1) <sub>2</sub> ][TFSA]	3.7	0.35	3.25	2.81	5.83	0.35
[Li(G1)(G2)][TFSA]	3.4	0.31	2.78	2.91	6.36	0.74
[Li(SL) <sub>2</sub> ][TFSA]	0.4	0.68	0.35	0.22	0.93	0.17
[Li(SL) <sub>3</sub> ][TFSA]	1.0	0.69	0.98	0.74	2.88	0.19

Table S2. Normalised five transport coefficients of all the electrolytes at 30 °C.

Sample	$\sigma^{self}_{+}/\sigma_{ion}$	$\sigma^{self}_{-}/\sigma_{ion}$	$\sigma^{distinct}_{~~++}/\sigma_{ion}$	$\sigma^{distinct}_{}/\sigma_{ion}$	$\sigma_{+-}/\sigma_{ion}$

[Li(SL) <sub>3</sub> ][TFSA]	0.81	0.61	-0.03	-0.54	-0.08

## List of Symbols

# Symbol

*A<sub>i</sub>* Onsager coefficient derivatives

<i>a</i>		
±	mean ion a	activity
		~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

<i>c</i> salt concentration	$(mol dm^{-3})$
-----------------------------	-----------------

 $D_{anion}$  self diffusion coefficient of anion derived from PFG-NMR (cm<sup>2</sup> s<sup>-1</sup>)

 $D_{Li}$  self diffusion coefficient of Li<sup>+</sup> derived from PFG-NMR (cm<sup>2</sup> s<sup>-1</sup>)

*F* Faraday constant (96485 C mol<sup>$$-1$$</sup>)

- $N_A$  Avogadro constant (6.022×10<sup>23</sup> mol<sup>-1</sup>)
- R universal gas constant (8.314 J mol<sup>-1</sup> K<sup>-1</sup>)

*T* temperature (K)

## Greek

$\sigma_{ion}$	total ionic conductivity measured by ac impedance spectroscopy (mS cm <sup>-1</sup> )
$\sigma_{ij}$	Onsager coefficients derived from species i and j (mS cm <sup>-1</sup> )
$\sigma^{self}$	Onsager coefficients derived from Nernst-Einstein equation, self-term (mS cm <sup>-1</sup> )
$\sigma^{distinct}$	Onsager coefficients of distinct term (mS cm <sup>-1</sup> )
