

Photo-oxidation Mechanism of Water on $\text{WO}_3(001)$ - A combined Embedded Cluster, Machine Learning and Wave Packet Approach

T. Teusch, T. Klüner

Carl von Ossietzky University, Oldenburg, Germany

S1 Supporting Information

S1.1 Basis set

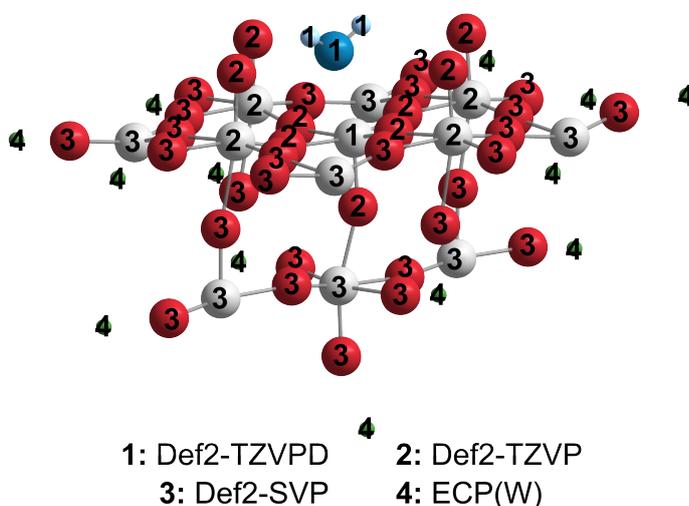

Figure S1: Assignment of the different basis sets on each atom within the cluster model.

S1.2 Grid for each jacobian coordinate

Table S1: Grid for each jacobian coordinate.

Jacobian Coordinate	Value range
$\vartheta / ^\circ$	0, 24, 48, 54.54, 72, 96, 120, 144, 168, 180
Y / Å	-3.49, -3.39, -3.28, -3.18, -3.07, -2.91, -2.75, -2.59, -2.43, -2.28, -2.12, -1.96, -1.80, -1.64, -1.48, -1.32, -1.16, -1.01, -0.85, -0.69, -0.53, -0.37, -0.21, -0.05, 0.11, 0.26, 0.42, 0.58, 0.74, 0.90, 1.06, 1.22, 1.38, 1.53 + specific points
Z / Å	18.52, 13.23, 7.94, 6.35, 5.29, 5.03, 4.76, 4.50, 4.23, 3.97, 3.70, 3.44, 3.18, 2.91, 2.65, 2.38, 2.28, 2.17, 2.06, 1.96, 1.85, 1.75, 1.64, 1.53, 1.32 + specific points

S1.3 Cluster size convergence

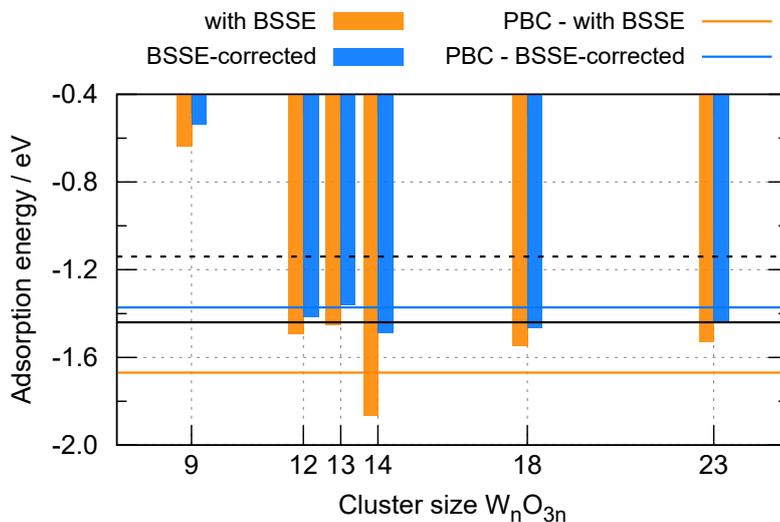

Figure S2: Convergence of the cluster size with respect to periodic boundary calculations (PBC) including the BSSE using PBE0.

S1.4 Different structures of the neural networks

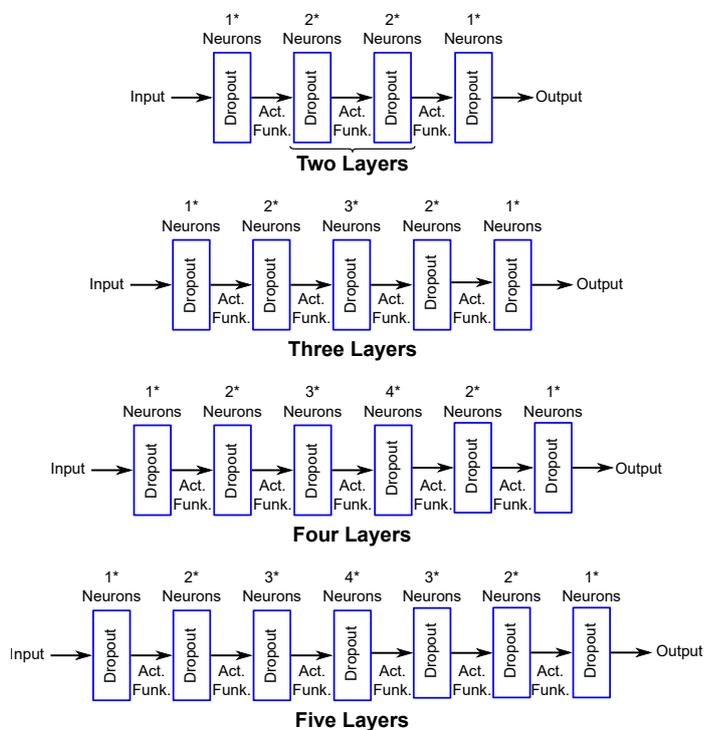

Figure S3: Structure of the neural networks in terms of layers and neurons.

S1.5 Activation functions

Table S2: Different activation functions σ including value range.

Name	Activation Function	Value Range
ReLU	$\sigma(x) = \begin{cases} x & \text{für } x \geq 0 \\ 0 & \text{sonst} \end{cases}$	$[0, \infty]$
Leaky ReLU	$\sigma(x) = \begin{cases} x & \text{für } x > 0 \\ 0.01 \cdot x & \text{sonst} \end{cases}$	$[-\infty, \infty]$
Rand. ReLU	$\sigma(x) = \begin{cases} x & \text{für } x > 0 \\ a \cdot x & \text{sonst} \end{cases}$	$[-\infty, \infty]$
SELU	$\sigma(x) = \lambda \begin{cases} x & \text{für } x > 0 \\ \alpha \cdot \exp(x) - \alpha & \text{sonst} \end{cases}$	$[-\alpha \cdot \lambda, \infty]$
CELU	$\sigma(x) = \begin{cases} x & \text{für } x \geq 0 \\ a \left(\exp\left(\frac{x}{a}\right) - 1 \right) & \text{sonst} \end{cases}$	$[a, \infty]$
tanh	$\sigma(x) = \frac{\exp(x) - \exp(-x)}{\exp(x) + \exp(-x)}$	$[-1, 1]$
Sigmoid	$\sigma(x) = \frac{1}{1 + \exp(-x)}$	$[0, 1]$
Tanhshrink	$\sigma(x) = x - \frac{\exp(x) - \exp(-x)}{\exp(x) + \exp(-x)}$	$[-\infty, \infty]$

Randomized ReLU: a is a random number between $\frac{1}{8}$ and $\frac{1}{3}$
 SELU: $\alpha = 1.6732632423543772848170429916717$
 $\lambda = 1.0507009873554804934193349852946$
 CELU: $a = 1$

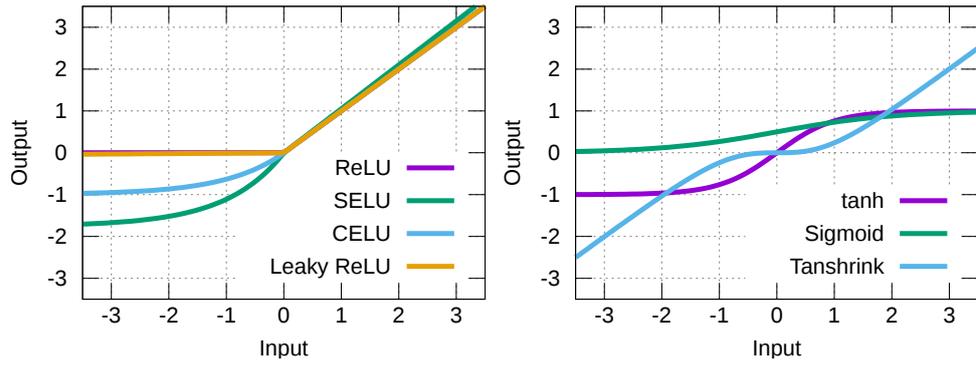

Figure S4: Visualisation of the *linear unit* activation functions (left) and classical functions (right).

S1.6 (2+2)-Genetic Algorithm Pseudocode

Algorithm 1 (2+2)-Genetic Algorithm

```

procedure (2+2)-GA
  Initialize two random parents
  Calculate fitness of both parents
  for  $i = 0, 99$  do
    Crossover
    Mutation
    Neural Network Fits
    parents  $\leftarrow$  best two solutions
  end for
  return best solution
end procedure

```

\triangleright 100 iterations \rightarrow 200 nets \rightarrow 1/5 of all data
 \triangleright Recombination of bitstrings
 \triangleright Using Rechenberg 1/5 rule

S1.7 Wave packet dynamics and photodesorption

We have used the split propagator throughout. Formulated in real time the following expression results:

$$\exp(-i\hat{H}\Delta t) \approx \exp\left(-i\frac{\hat{T}}{2}\Delta t\right) \cdot \exp(-i\hat{V}\Delta t) \cdot \exp\left(-i\frac{\hat{T}}{2}\Delta t\right) \quad (\text{S.1})$$

In imaginary time we substitute the time t with the imaginary time $\tau = i \cdot t$ resulting in

$$\exp(-\hat{H}\tau) \approx \exp\left(-\frac{\hat{T}}{2}\tau\right) \cdot \exp(-\hat{V}\tau) \cdot \exp\left(-\frac{\hat{T}}{2}\tau\right) \quad (\text{S.2})$$

Due to the exponent term, all summands are now striving towards 0 if the propagation time is sufficiently long. Since the ground state wave function is energetically lowest, this state remains longest. The simulation of the photodesorption process is depicted in figure S5 with different residence lifetimes τ_n .

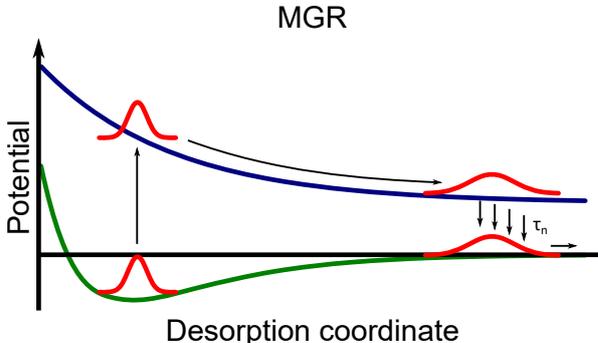

Figure S5: Menzel-Gomer-Redhead (MGR) mechanism of the photodesorption process [1,2].

The wave packet is generated on the ground state (green potential) by imaginary time propagation and then vertical transferred to the CT state (blue potential). The wave packet is then propagated on the CT state in real time. We performed the *jumping wave packet method* to relax the wave packet back on the ground state after selected time steps and propagated it there until convergence of the expectation values. It has been shown that this procedure is equivalent to a solution of the Liouville-Neumann equation for open quantum systems [3]. Although this jumping wave packet scenario is a simple way to treat electronic relaxation, it has been shown that this stochastic approach gives almost identical results to the Surrogate Hamiltonian method which treats the whole photodesorption scenario, including electronic relaxation, in a much more sophisticated model from first principles [4].
