**Harmonic bond style potential:**  $E = K (r - r_0)^2$

$K$ : (energy/distance<sup>2</sup>)

$r_0$ : equilibrium bond distance

**Harmonic angle style potential:**  $E = K (\theta - \theta_0)^2$

$K$ : prefactor (energy)

$\theta_0$ : equilibrium angle value

**Charmm dihedral style potential:**  $E = K [1 + \cos (n\phi - d)]$

**TABLE S2.**

**Example simulation results for water viscosity, with uncertainties; 12ns duration. Pure water; 3 independent system configurations, SPC/E water model, 11089 water molecules, 20°C.**

The first 6ns of the simulations are dropped from analysis, with the remaining 6 ns used for production (the simulation is shown here split into time-blocks of 2ns). Viscosity values, computed every 500 fs, are averaged over the latter 6 ns to yield a mean value for each simulation production run. Prediction uncertainty is calculated as standard deviation from the mean average value of three production runs, and lies within 2%, for all salt types and concentrations considered.

**TABLE S4.**

**Example simulation results for water viscosity; 22ns duration.** A final simulation was conducted for 22 ns. Comparing results from Tables S2-S4, we conclude 12ns to be sufficient for obtaining equilibrated viscosity values; within the viscosity range of  $0.795 \pm 0.0473$  mPa s<sup>11</sup> reported for SPC/E water at 19.85°C (293K).

| Configuration 3 |                   |                    |
|-----------------|-------------------|--------------------|
| Time (ns)       | Viscosity [mPa s] | Standard deviation |

| <b>20-22</b>    | 0.771             | 0.000              |

**TABLE S5.**

**Example simulation results for water self-diffusion, with uncertainties.**

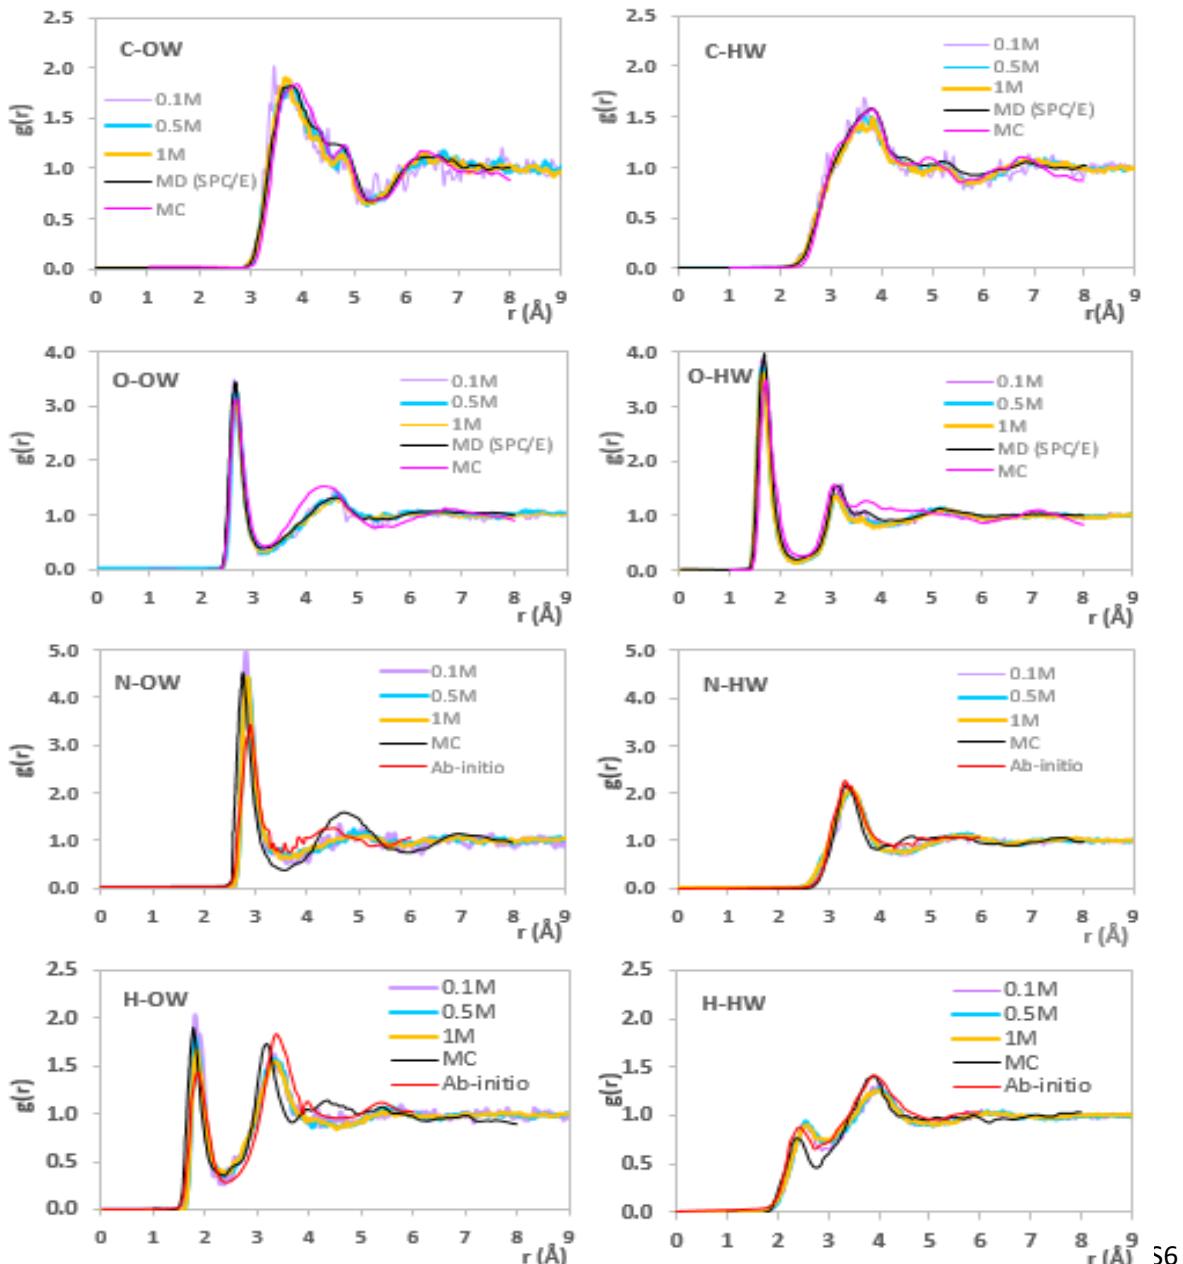

Self-diffusion coefficients were obtained from three independent simulations of 4.5ns each; 1ns equilibration time and 3.5ns production. Mean-squared displacement (MSD) values were obtained utilising in-built LAMMPS code. Self-diffusion coefficients were subsequently obtained from the slope of MSD over time using the Einstein relation<sup>12</sup>. Uncertainty for diffusion coefficient results is calculated as the standard deviation from the mean average of three independent simulations per concentration for each salt type.

*Example results for water self-diffusion in 1M barium acetate aqueous solution:*

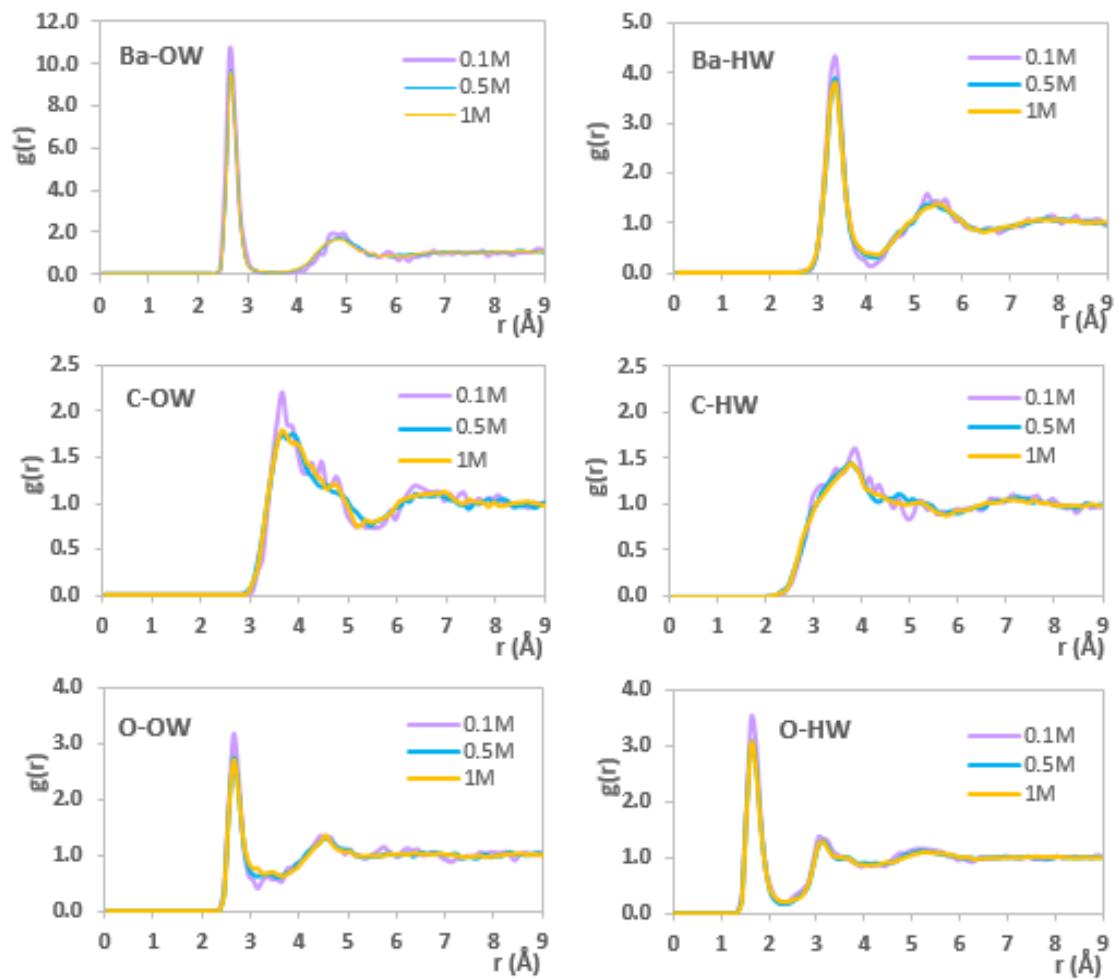

|  | Simulation 1 | Simulation 2 | Simulation 3 | Average of 3 simulations                     |
|--|--------------|--------------|--------------|--|
| D ( $10^{-9}\text{m}^2/\text{s}$ ):        | 1.54         | 1.57         | 1.52         | 1.54   |
| Standard deviation: $2.41 \times 10^{-11}$ |              |              |              | Expressed as a percentage of the mean: 1.56% |

**FIGURES S3 – S6: ION-WATER RADIAL DISTRIBUTION FUNCTIONS, AT 26°C.**

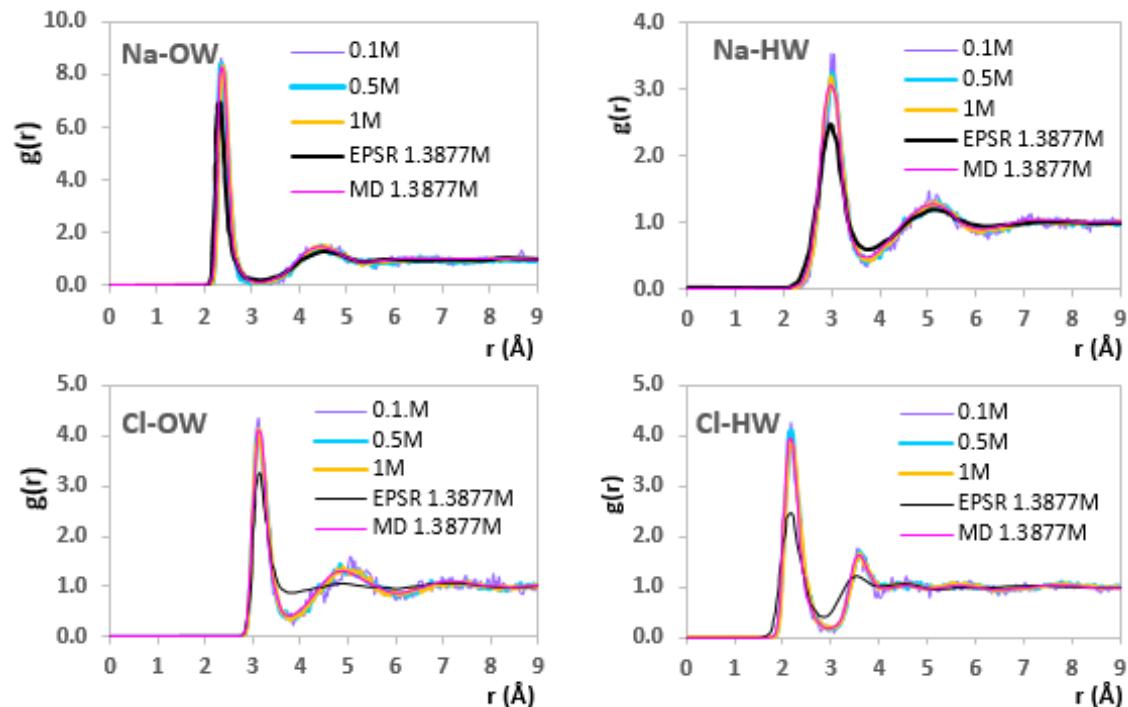

**FIGURE S3.** Ammonium acetate in aqueous solution: ion-water RDFs, concentration M=0.1 to 1. Simulation results from literature, obtained using MD with SPC/E water for the acetate ion<sup>13</sup> and Monte-Carlo (MC) methods with SPC/E for both acetate and ammonium ions<sup>14</sup>, are shown alongside for comparison. Reference atoms for the acetate ion are carboxylate group oxygens and methyl group carbon.

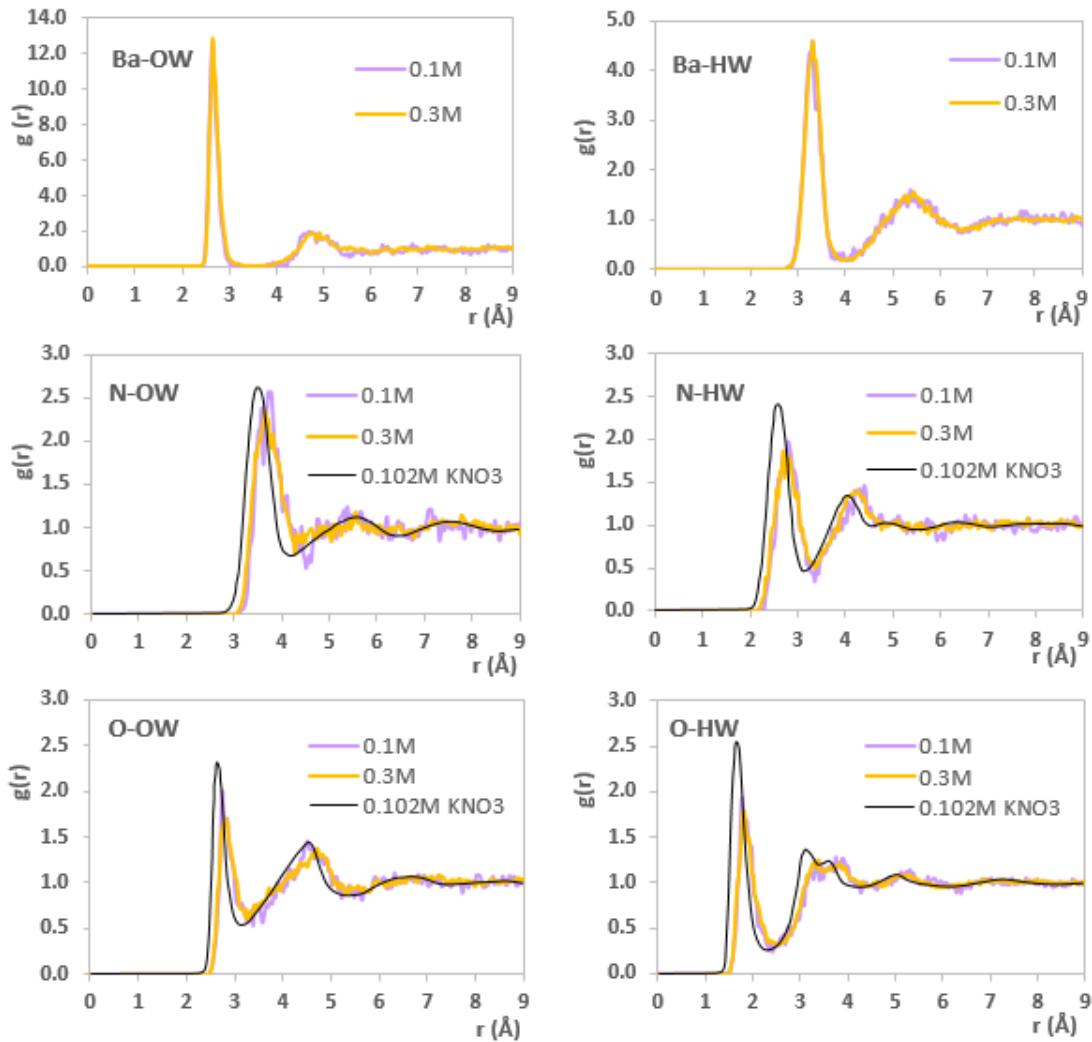

**FIGURE S4.** Barium acetate in aqueous solution: ion-water RDFs, concentration  $M$  = 0.1 to 1:

**FIGURE S5.** Sodium chloride in aqueous solution: ion-water RDFs, concentration  $M$  = 0.1 to 1. Literature results, from the Empirical Structural Refinement (EPSR) approach<sup>15</sup> and MD simulations with SPC/E water and Joung-Cheatham ion parameters ( $24.85^{\circ}\text{C}$ ,  $M$  = 1.3877)<sup>15</sup>, are shown for comparison.

**FIGURE S6.** Barium nitrate in aqueous solution: ion-water RDFs, at  $M = 0.1$  and  $0.3$ . Literature data for the nitrate ion, shown for comparison: aqueous (SPC/E) potassium nitrate solution at  $26.85^\circ\text{C}$ ,  $0.102\text{ M}$ <sup>16</sup>.

**FIGURE S7:**

Jones-Dole plots and resulting B-coefficients calculated from experimental viscosity data obtained in the present work (reported in main text). Values are assumed to be additive, and should be viewed tentatively due to the limited number of sample concentrations, but are presented here for readers that may be interested.

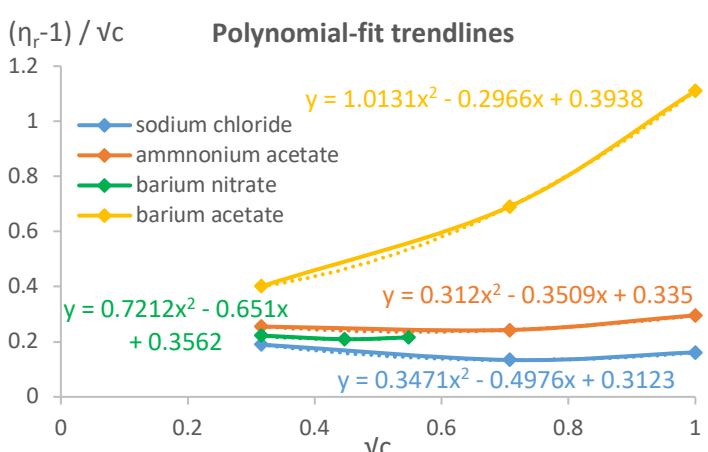

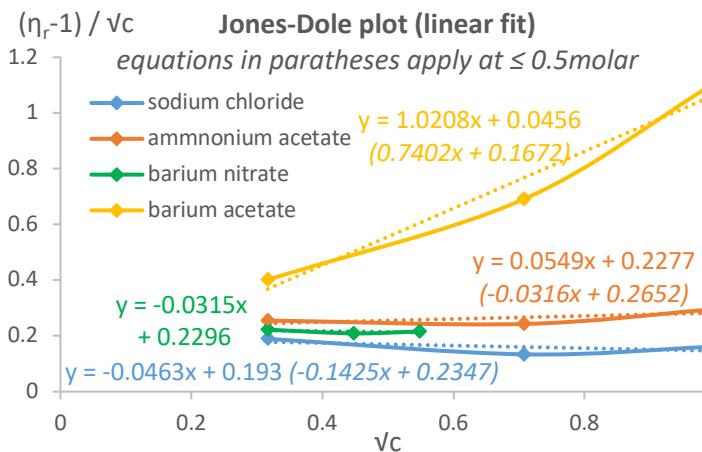

- In very dilute solutions (experimental data concentration range: 0.005 to 1 molal) forces are proportional to the square root of electrolyte concentration, hence the expression for **fluidity** (original Jones-Dole expression)<sup>17)</sup> in the form:

$$\varphi = 1 + A\sqrt{c} + Bc$$

implemented by subsequent authors<sup>18)</sup> to express **relative viscosity** ( $\eta_r = \eta/\eta_0$ ).

**A:** accounts for long range electrostatic/Coulombic interactions, dominating at dilute regimes

**B:** adjustable, additive parameter related to ion size and proportional to partial molar entropies of the ions, accounting for non-electrostatic interactions that emerge at higher salt concentrations (>0.1M).

| SALT:            | $B$ (concentrations $\leq 1$ molar), $26^\circ\text{C}$ | $B$ (concentrations $\leq 0.5$ molar), $26^\circ\text{C}$ | Compiled from (Table 3 of ref.17): 'selected' values, at $25^\circ\text{C}$ |
|------------------|---|---|---|
| Barium acetate   | <b>1.0208</b>   | <b>0.7402</b>   | <b>0.708</b>  |
| Barium nitrate   | <b>-0.0315</b>  | <b>-0.0315</b>  | <b>0.13</b>   |
| Ammonium acetate | <b>0.0549</b>   | <b>-0.0316</b>  | <b>0.238</b>  |
| Sodium chloride  | <b>-0.0463</b>  | <b>-0.1425</b>  | <b>0.08</b>   |

**TABLE S6.**  
Approximate proportion of total water 'engaged' in first hydration shells of ions: 1M aqueous solutions.

Water molecules: 11089. Number of ions shown at 1 molar concentration, with exception of barium nitrate (0.3 molar). Coordination numbers taken from **Table 5** (in main text, with references).

| SALT:            | Number of ions in the system  | (First shell) ion coordination number  | Proportion of total water 'engaged' |
|------------------|---|--|-------------------------------------|
| Sodium chloride  | $(\text{Na}^+ \rightarrow 200)$<br>$(\text{Cl}^- \rightarrow 200)$                | $(\text{Na}^+ \rightarrow 5)$<br>$(\text{Cl}^- \rightarrow 6)$                 | $2200/11089 \rightarrow \sim 20\%$  |
| Ammonium acetate | $(\text{NH}_4^+ \rightarrow 200)$<br>$(\text{CH}_3\text{CO}_2^- \rightarrow 200)$ | $(\text{NH}_4^+ \rightarrow 5)$<br>$(\text{CH}_3\text{CO}_2^- \rightarrow 16)$ | $4200/11089 \rightarrow \sim 38\%$  |
| Barium acetate   | $\text{Ba}^{2+} \rightarrow 200$<br>$(\text{CH}_3\text{CO}_2^- \rightarrow 400)$  | $\text{Ba}^{2+} \rightarrow 8$<br>$(\text{CH}_3\text{CO}_2^- \rightarrow 16)$  | $8000/11089 \rightarrow \sim 72\%$  |
| Barium nitrate   | $\text{Ba}^{2+} \rightarrow 70$<br>$(\text{NO}_3^- \rightarrow 140)$              | $\text{Ba}^{2+} \rightarrow 8$<br>$(\text{NO}_3^- \rightarrow 21)$             | $4200/11089 \rightarrow \sim 32\%$  |
