1. General Information a. Materials

All reactions were carried out under nitrogen atmosphere on a standard nitrogen/vacuum line. The glassware was dried by the use of a heat gun or in an oven at 130°C. Commercially available reagents were purchased reagent-grade and used without further purification. All chemicals were purchased from Sigma Aldrich (Switzerland), except potassium perrhenate (>99%, Chempur, Germany). The chemicals were used without further purification. Deuterated NMR solvents were obtained from Armar Chemicals (Switzerland).

b. Characterization

FT-IR spectra were acquired on a Perkin Elmer Spectrum Two spectrophotometer equipped with a Specac Golden Gate single reflection diamond accessory. ¹H-NMR, ¹³C{¹H}-NMR and DEPT-NMR spectra were recorded on a BrukerDRX 500 MHz spectrometer. ¹H and ¹³C chemical shifts were referenced with the residual solvent resonance relative to TMS.

Preparative HPLC was performed on a Varian ProStar 320 system, using a Dr. Maisch Reprosil C18 100-7 (40 x 250mm) column. The solvents (HPLC grade) were 0.1% trifluoroacetic acid (solvent A) and acetonitrile (solvent B). Analytical HPLC was performed on a VWR HITACHI Chromaster system, using a Macherey-Nagel Nucleosil C18 100-5 column. HPLC solvents were 0.1% trifluoroacetic acid (solvent A) and acetonitrile (solvent A) and acetonitrile (solvent A) and acetonitrile (solvent A).

Electrospray-ionisation mass spectrometry (ESI-MS) was performed on a Bruker esquireTM/LC spectrometer or on a Bruker esquireTM/HCTTM spectrometer. High-resolution mass spectrometry (HR-ESI-MS) was performed on a Bruker maXis QTof high-resolution mass spectrometer (Bruker GmbH, Bremen, Germany).

Electrochemical measurements were carried out in acetonitrile and dimethylformamide containing 0.1M TBA[PF₆] as a conducting electrolyte. A Metrohm 757VA Computrace electrochemical analyzer was used with a standard three-electrode setup of glassy carbon working electrode (i.d.= 3mm), platinum auxiliary electrode and Ag/AgCl reference electrode. All potentials are given vs Ag/AgCl and are referenced with Fc/Fc⁺ at 450mV. Elemental Analysis (EA) measurements were performed on a LecoCHNS-932 elemental analyzer.

UPLC-ESI-MS was performed on a Waters Acquity UPLC System coupled to a Bruker HCTTM, using an Acquity UPLC BEH C18 1.7µm (2.1 x 50mm) column. UPLC solvents were formic acid (0.1% in millipore water) (solvent A) and acetonitrile HPLC grade (solvent B). Applied UPLC gradient: 0-0.5 minutes: 95% A, 5% B; 0.51-4.0 minutes: linear gradient from 95% A (5% B) to 0% A (100% B); 4-5 minutes: 100% B. The flow rate was 0.6 ml/min. Detection was performed between 250nm and 480nm (DAD).

²

X-ray Crystallographic data were collected at either 160.0(1) or 183(1)K with either Mo K α radiation (λ = 0.7107Å) or Cu K α radiation (λ = 1.54184Å). Compounds [**2a**](PF₆), [**2b**](PF₆) and [**4a**](PF₆) were measured on an Oxford Diffraction CCD Xcalibur system with a Ruby detector while compounds [**5a**](PF₆), [**6b**](PF₆), [**7a**](PF₆), [**7b**](PF₆), decomposition of [**7b**](PF₆) and [**12a**]OTf were measured on a Rigaku-Oxford Diffraction, dual source, XtaLAB Synergy system with Dectris Pilatus3 R 200K. Suitable crystals were covered with oil (Infineum V8512, formerly known as Paratone N), placed on a nylon loop that is mounted in a CrystalCap MagneticTM (Hampton Research) and immediately transferred to the diffractometer. Data were corrected for Lorentz and polarisation effects as well as for absorption (numerical). The program suite CrysAlis^{Pro} was used for data collection, multi-scan absorption correction and data reduction.¹ The structures were solved with direct methods using ShelxT² and were refined by full-matrix least-squares methods on *F*² with with SHELXL-2014.³ The structures were checked for higher symmetry with help of the program Platon.⁴ Supplementary crystallographic data can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/structures (CCDC nr. 1957333 to 1957341).

Synthesis according to literature.⁵

Synthesis: 300mg (0.61mmol) of [**1**](OTf) was dissolved in 30mL dry THF and cooled to -78°C. 1.5mL (1.53mmol, 2.5 eq.) of a 1M LDA in THF/hexane solution was slowly added to the yellow suspension. The reaction was stirred for 1.5h at -78°C and then 721.9mg (3.05mmol, 5 eq.) hexachloroethane was added to the dark orange solution. Stirring was continued for 7 h at -78°C and monitored by UPLC-MS. The colour of the solution changed from orange to yellow. The reaction was quenched with MeOH/HCI solution and the volume of mixture reduced under vacuum to 5mL. The orange solution was extracted with hexane (3 x 2.5mL) and evaporated in *vacuum*. The residue was purified by *preparative HPLC* (Reprosil 100 C18, 250mm x 40mm, 0.1% TFA/CH₃CN, linear gradient: 15-30% CH₃CN in 45min, 40mL/min, detection at 270nm). The products were precipitated upon addition of NH_4PF_6 to yield analytically pure, yellow [**2a**](PF₆), [**2b**](PF₆) and [**2c**](PF₆). Suitable crystals for X-ray for all compounds were obtained by slow evaporation from CH₃CN/H₂O (1:1). Yields: 151.7mg (0.28mmol, 47.6%) for [**2a**](PF₆), 52.3mg (0.09 mmol, 15%) for [**2b**](PF₆) and 9.2mg (0.015mmol, 2.5%) [**2c**](PF₆).

Synthesis: 200mg (0.41mmol) of [1](OTf) was dissolved in 20mL dry THF and cooled to -78°C. 0.62 mL (0.62mmol, 1.5 eq.) of a 1M LDA in THF/hexane solution was slowly added to the yellow suspension. The reaction was stirred for 1.5h at -78°C and then 2mL (25.9mmol, 63eq.) dry dimethylformamide was added to the dark orange solution. Stirring was continued for 4h at -78°C and monitored by UPLC-MS. The colour of the solution changed to light orange. The

reaction was quenched with acidic water (H₂O/TFA, 0.1%) and the volume of mixture reduced under vacuum to 5mL. The residue was purified by *preparative HPLC* (Reprosil 100 C18, 250x40mm, 0.1% TFA/CH₃CN, isocratic gradient: 5% CH₃CN in 45min, 40mL/min, detection at 270nm). Product [**3a**](TFA) was obtained analytically pure as an orange oil. [**3b**]TFA was not totally pure. It was then redissolved in water, and NH₄PF₆ was added to change the counter ion. A continuous liquid-liquid extraction (DCM/water) was performed to get the product in the organic phase. After evaporation of the solvent, the solid was washed with a minimum amount of cold water to get an orange solid analytically pure. Yields: 74mg (0.153mmol, 37.8%) for [**3a**](TFA) and 13.2mg (0.0243mmol, 5.9%) for [**3b**](PF₆).

Synthesis: To a solution of [**11a**](OTf) (18.6mg, 0.023mmol) in 5ml of MeOH was added 102.4mg (0.468mmol, 20 eq.) of CoBr₂. The solution changed the color immediately from light yellow to pink. The reaction was controlled by UPLC-MS. After 40min, the peak in the chromatogram corresponding to complex [**11a**](OTf) disappeared and a new peak with a m/z corresponding to complex [**12a**]Br appeared. The solvent was evaporated in vacuum and the solid was washed multiple times with Et₂O until all remaining CoBr₂ was removed. The brownish solid was then dried under high vacuum to give analytically pure [Re(η^6 -C₆H₅C((OH)(C₂₀H₁₄N₄)Co)(η^6 -C₆H₆)](Br)₃. Yield: 21.4mg (0.022mmol, 93.2%) of [Re(η^6 -C₆H₅C((OH)(C₂₀H₁₄N₄)Co)(η^6 -C₆H₆)](Br)₃.

Synthesis: To a solution of [**11a**](OTf) (5.50mg, 0.007mmol) in 4ml of acetonitrile was added 2.38mg (0.007mmol, 1 eq.) of Co(OTf)₂. The solution changed the color immediately from light to dark yellow. The reaction was controlled by UPLC-MS. After 40min, the peak in the chromatogram corresponding to complex [**11a**](OTf) disappeared and a new peak with a m/z corresponding to complex [**12a**]OTf appeared. The solvent was evaporated in vacuum to give analytically pure yellow [Re(η^6 -C₆H₅C((OH)(C₂₀H₁₄N₄)Co)(η^6 -C₆H₆)](H₂O)(OTf)₃ in quantitative yield. Single crystals, suitable for X-ray diffraction analysis were obtained by slow evaporation from acetonitrile.

7. Photocatalysis experiments and in-line H₂ detection

Scheme S1. Half-reaction (proton reduction) water-splitting system with $[Ru(bpy)_3]^{2+}$ as photosensitizer, ascorbic acid as electron relay and TCEP as a sacrificial electron donor.

The samples for catalysis were prepared by mixing the photosensitizer $[Ru(bpy)_3]Cl_2 \cdot 5$ H₂O (PS, µM), sodium ascorbate (NaAsc, 0.1M), tris(2-carboxyethyl) phosphine hydrochloride (TCEP, 0.1 M) and the corresponding WRC [**12a**]Br (with final concentrations of 1, 5, 10, 20 and 100µM, respectively) in water (approximately 5mL). The mixture was titrated (pH-meter from Mettler Toledo SevenEasy with an InLab Semi-Micro pH electrode) with NaOH (2M) to a pH of 5.00 (variation between pH 4.99 and 5.01). Finally, the samples were filled up with H₂O to a total reaction volume of 10mL. The catalytic solution was connected to the argon line with a controlled flow of 6.0 ± 0.15mL/min and directly dried and degassed under stirring until oxygen and nitrogen have been vanished. After degassing, irradiation was started from the bottom with an LED lamp (453nm, 80 ± 5mW, photon flux of 0.35 ± 0.02µE/s). Gas chromatograms were recorded on a Bruker 450 or Bruker 456 GC gas chromatograph by using argon as carrier gas (20 mL/min for both reference and sample), a column of 3m x 2mm packed with molecular sieves 13X 80-100, an oven operated isothermally at 100°C and a thermal conductivity detector operated at 150°C. Automated measurements were performed using a home made in-line setup (Scheme 2)
