

Luminescent Polypyridyl Heteroleptic Cr^{III} Complexes with High Quantum Yields and Long Excited State Lifetimes

Juan-Ramón Jiménez,* Maxime Poncet, Benjamin Doistau, Céline Besnard and Claude Piguet*

Supporting Information

(37 pages)

Appendix 1. Experimental section.

Solvents and starting materials

Reagent grade acetonitrile (ACN) was distilled from CaH₂. All other chemicals such as CrCl₃·3THF, AgCF₃SO₃, (*n*-Bu₄)NPF₆ and organic solvents were purchased from commercial suppliers and used without further purification. The ligand ddpd, dqp and dqpOMe were prepared according to published methods.^{S1-S2}

Preparation of [Cr(dqp)Cl₃]. The ligand dqp (250 mg, 0.75 mmol) was added into a solution of CrCl₃·3THF (280 mg, 0.75 mmol) in propan-2-ol (15 mL). The resulting green solution was heated in a microwave to 160°C during 4 h. The mixture was filtered and the green solid was washed with warm ethanol (2 x 10 mL), dichloromethane (20 mL) and diethyl ether (2 x 20 mL). The product was dried under vacuum to obtain a crystalline green powder [Cr(dqp)Cl₃] (yield 90%). Slow diffusion of diethyl ether into a concentrated solution of the complex in *N,N'*-dimethylformamide led to the formation of green crystals suitable for X-ray diffraction. Elemental analysis: Calcd for: C₂₃H₁₅Cl₃CrN₃·0.1H₂O·0.3CH₂Cl₂ C, 53.9; H, 3.42; N, 8.09. Found C, 53.8; H, 3.47; N, 8.11.

Preparation of [Cr(dqp)(SO₃CF₃)₃]. A mixture of [Cr(dqp)Cl₃] (50 mg, 0.09 mmol) and silver triflate (83 mg, 0.32 mmol) in distilled acetonitrile (1 mL), was heated under microwave irradiation in a sealed cap at 140°C during 30 min. After cooling to room temperature, the resulting red solution was filtered to remove the AgCl generated during the reaction. ESI-MS (CH₃CN) *m/z*: [Cr(dqp)(OSO₂CF₃)₂]⁺ calc: 682.9, found: 682.9 (Figure S1). This solution was used directly for the next step.

Preparation of [Cr(dqp)(tpy)](PF₆) (1). A red solution of [Cr(dqp)(OSO₂CF₃)₃] in distilled acetonitrile was loaded into a 5 ml MW vial containing 1 equivalent of the tpy ligand in 1 mL of CH₃CN. The solution was heated under microwave irradiation for 12h at 70°C. After cooling to room temperature, the solvent was removed under reduced pressure yielding an orange residue. The orange residue was dissolved in methanol (2 mL) and few drops of a saturated methanol solution of (*n*-Bu₄)NPF₆ were added. The yellow precipitate was filtered and washed with cold MeOH (1 x 5 mL), dichloromethane (20 mL) and diethyl ether (2 x 15 mL) to give [Cr(dqp)(tpy)](PF₆)₃ (yield 40%) as a fine yellow powder. Slow diffusion of diethyl ether into a concentrated solution of the complex in acetonitrile led to the formation of orange crystals suitable for XRD. Elemental Analysis: Calcd for C₃₈H₂₆CrF₁₈N₆P₃·2.2CH₂Cl₂·1.3CH₃CN: C, 39.73; H, 2.67; N, 7.9 found C, 39.72; H, 2.68; N, 7.90.

Preparation of [Cr(dqp)(L)](CF₃SO₃)₃ (L = ddpd (2) dqpOMe (3)). A red solution of [Cr(dqp)(OSO₂CF₃)₃] in distilled acetonitrile was loaded into a 5 ml MW vial containing 1 equivalent of ddpd or dqpOMe in 1 mL distilled acetonitrile. The solution was heated under microwave irradiation for 6h at 120°C and 140°C respectively. After cooling to room temperature, acetonitrile was added and the mixture filtered to remove impurities. The solvent was then removed under reduced pressure yielding an orange residue. The orange residue was dissolved in water, filtered, evaporated again and dried under vacuum to give [Cr(ddpd)(dqp)](CF₃SO₃CF₃)₃ (yield 60%) and [Cr(dqp)(dqpOMe)](CF₃SO₃)₃ (yield

80%). The orange residue was dissolved in acetonitrile and precipitate slowly with diethyl ether to give in both cases an orange/yellow precipitate which was washed with cold MeOH (1 x 5 mL), dichloromethane (20 mL) and diethyl ether (2 x 15 mL). Slow diffusion of diethyl ether into a concentrated solutions of the complexes in acetonitrile led to the formation of orange crystals suitable for XRD. ESI-MS (CH₃CN) *m/z*: [Cr(ddpd)(dqp)](CF₃SO₃)₂⁺ calc: 945.9, found: 946.0. Elemental analysis: Calcd C₅₃H₄₀CrF₉N₆O₁₀S₃·0.9CH₂Cl₂·0.35CH₃CN: C, 49.27; H, 3.25 N, 6.68 found C, 49.14; H, 2.99; N, 6.94. ESI-MS (CH₃CN) *m/z*: [Cr(dqp)(dqpOe)](CF₃SO₃)₂⁺ calc: 1046., found: 1046.1. Elemental analysis: Calcd C₄₃H₃₂CrF₉N₈O₉S₃·1.3H₂O: C, 45.01; H, 3.04 N, 9.77 found C, 45.01; H, 3.05; N, 9.75.

Spectroscopic and analytical measurements.

Pneumatically-assisted electrospray (ESI) mass spectrum was recorded from 10⁻⁴ M solution on an Applied Biosystems API 150EX LC/MS System equipped with a Turbo Ionspray source[®]. Elemental analyses were performed by K. L. Buchwalder from the Microchemical Laboratory of the University of Geneva. Absorption spectra in water solution were recorded using a Lambda 1050 Perkin Elmer spectrometer (quartz cell path length 1 cm or 1 mm, 290-800 nm domain, 2×10⁻⁴ mol/L and 650-800 nm domain). Emission spectra (excitation at 355 nm) was recorded from either room temperature or frozen solution samples (for frozen solutions: CH₃CN/propionitrile 6/4 at C ≈ 5×10⁻³ mol/L), or freeze-pump-thaw degassed acetonitrile solution (C ≈ 10⁻⁴ mol/L) for room temperature solutions 293 K, with a Fluorolog (Horiba Jobin-Yvon), equipped with iHR320, a Xenon lamp 450 Watt Illuminator (FL-1039A/40A) and a water-cooled photo multiplier tube (PMT Hamamatsu R2658 or R928), and corrected for the spectral response of the system. The emission spectra were recorded as a function of the wavelength and transformed into wavenumbers.^{S3} For time-resolved experiments, the decay curves were recorded from previously excited samples at 77K and 293K, with a photomultiplier (Hamamatsu R2658 or R928) and a digital oscilloscope (Tektronix MDO4104C). Pulsed excitation at 355 nm was obtained with the third harmonic of a pulsed Nd:YAG laser (Quantel Qsmart 850). Low temperature (77 K) was achieved using liquid quartz transparent Dewar filled with liquid N₂ in the centre of which samples were placed. Samples solutions (CH₃CN/propionitrile) 6/4 at C ≈ 5×10⁻³ mol/L, were introduced in quartz tube (4 mm interior diameter) and introduced into the sample holder of the Dewar. The oxygen free decay curve measurements were recorded at 293 K for acetonitrile solutions of the complex (C ≈ 10⁻⁵ mol/L). Aerated solutions were prepared by using no-degassed water as solvent. All emission quantum yields were measured according to the relative method using the reported [Cr(ddpd)₂]³⁺ (Φ_{Cr}^L = 12.1%; λ_{exc} = 435 nm). The measurement was carried out by following the previously reported method (IUPAC Technical Report).^{S4} The measurements were achieved in CH₃CN, at room temperature and λ_{exc} = 435 nm (manifold Cr(⁴T₂←⁴A₂)/LMCT). Molar concentrations were adjusted to 1×10⁻⁵ M.

X-Ray Crystallography.

Summary of crystal data, intensity measurements and structure refinements for *rac*-[Cr(dqp)(tpy)](PF₆)₃, *rac*-[Cr(ddpd)(dqp)](CF₃SO₃)₃ and *rac*-[Cr(dqp)(dqpOMe)](CF₃SO₃)₃ compound were collected in Tables S1-S12 (ESI). The crystals were mounted on MiTeGen cryoloops with protection oil. X-ray data collections were performed with an Agilent SuperNova Dual diffractometer equipped with a CCD Atlas detector (Cu[K α] radiation) or a Rigaku synergy S equipped with an hypix detector. The structures were solved in SHELXT by using dual space methods.^{S5} Full-matrix least-square refinements on F^2 were performed with SHELXL^{S6} within the Olex2 program.^{S7} CCDC 2015187-2015190 contain the supplementary crystallographic data. The cif files can be obtained free of charge on www.ccdc.cam.ac.uk.

^a Not given because of the overlap with LMCT

Table S14. Energies of the Cr(⁴A₂), Cr(²T₁) and Cr(²E) levels and ligand field Δ and Racah parameters B and C computed with eqs S1-S3 for [Cr(dqp)(tpy)]³⁺ (1) [Cr(ddpd)(dqp)]³⁺ (2) and [Cr(dqp)(dqpOMe)]³⁺ in acetonitrile solution at 293 K.

Racah parameters B and C have been estimated with the help of eqs S1-S3.^{S8-S10}

$$E(^4T_2) = \Delta \quad (S1)$$

$$E(^2T_1) = 9B + 3C - 24(B^2/\Delta) \quad (S2)$$

$$E(^2E) = 9B + 3C - 50(B^2/\Delta) \quad (S3)$$

Compound	Δ /cm ⁻¹	B /cm ⁻¹	C /cm ⁻¹	Δ/B	C/B	² T ₂ /cm ^{-1^b}	⁴ T ₁ /cm ^{-1^b}	Reference
