1. General descriptions

1.1. Materials and characterization

All the materials and solvents were obtained commercially and used as received without further purification. Proton NMR spectra were measured on a Bruker AV400 spectrometer. High resolution mass spectra (HRMS) were recorded with a TOF 5600^{plus} mass spectrometer. X-ray crystallography diffraction was carried out on a Bruker SMART Apex CCD diffractometer. Cyclic voltammetry (CV) was measured on a CHI1140B Electrochemical Analyzer through a three-electrode system with a glassy carbon disk as the working electrode, platinum plate as the counter electrode and Ag/AgCl as the reference electrode. UV/Vis absorption spectra were recorded on a Purkinje General TU-1901 spectrophotometer. The PL spectra were recorded on a PerkinElmer LS-55 fluorescence spectrophotometer. The PL quantum efficiency and lifetime were measured with an Edinburgh FLS980 instrument.

1.2. Computational methodology

B3LYP functional was used to optimize the geometrical structures of ground state (S_0).^[1] A “double- ξ ” quality basis set consisting of Hay and Wadt’s effective core potentials (ECP), LANL2DZ,^[2] was employed to the Ir atom. 6-31G(d) basis set^[3] was applied to other nonmetallic atoms. The solvent effect in CH_2Cl_2 medium was considered throughout the calculations. Combined with VMD program,^[5] the molecular orbital was visualized by Multiwfn code.^[4] The frontier molecular orbital (FMO) distribution in molecules was analyzed by Multiwfn using Mulliken population analysis. Gaussian 16 software package was used for calculations.^[6]

1.3. OLED fabrication

The OLEDs were grown on pre-patterned ITO coated glass ($\approx 20 \Omega \text{ square}^{-1}$). Before depositing into the evaporation system, the ITO substrates were cleaned with acetone, ethyl alcohol, and deionized water by ultrasonic cleaning machine for 20 min. All the devices were deposited sequentially under fine vacuum of $8 \times 10^{-5} \text{ Pa}$. The organic transport materials were grown by the rate of 0.08-0.15 nm s^{-1} , while organic dopants, AlQ₃ were deposited at the rate of 0.02-0.15 \AA s^{-1} ,

Al was deposited by the rate of 3 \AA s^{-1} . The CIE coordinates, luminance, and EL spectra were carried out by a PR655 spectra-scan photometer simultaneously. The current density-voltage characteristics were tested by a programmable Keithley source-measure 2400 and PR655 spectra-scan.

2.

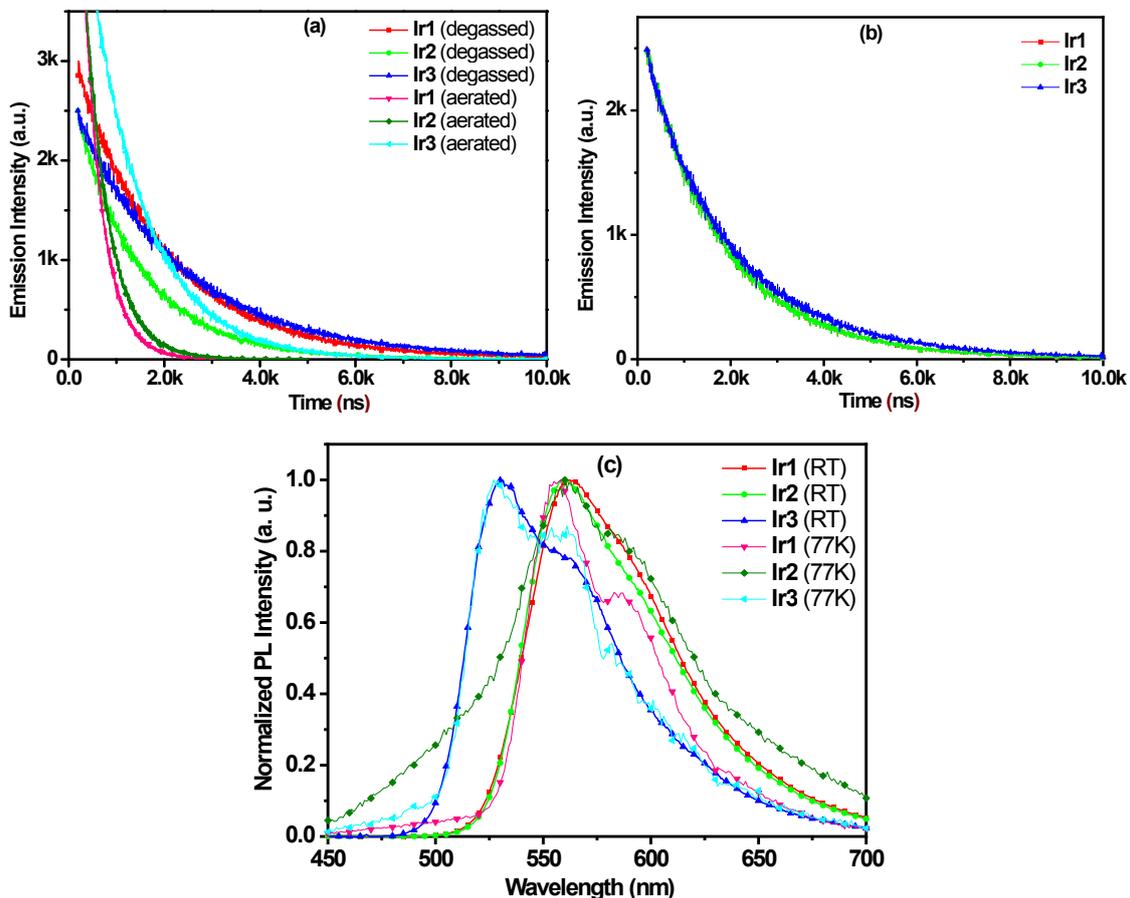

Fig. S1 The emission decay curves ((a) in degassed and aerated CH_2Cl_2 ; (b) in PMMA films at a conc. of 1 wt%) and (c) PL spectra (at RT and 77K) of new iridium complex in PMMA films.

3.

Table S1 Supplementary physical properties for the iridium complexes.

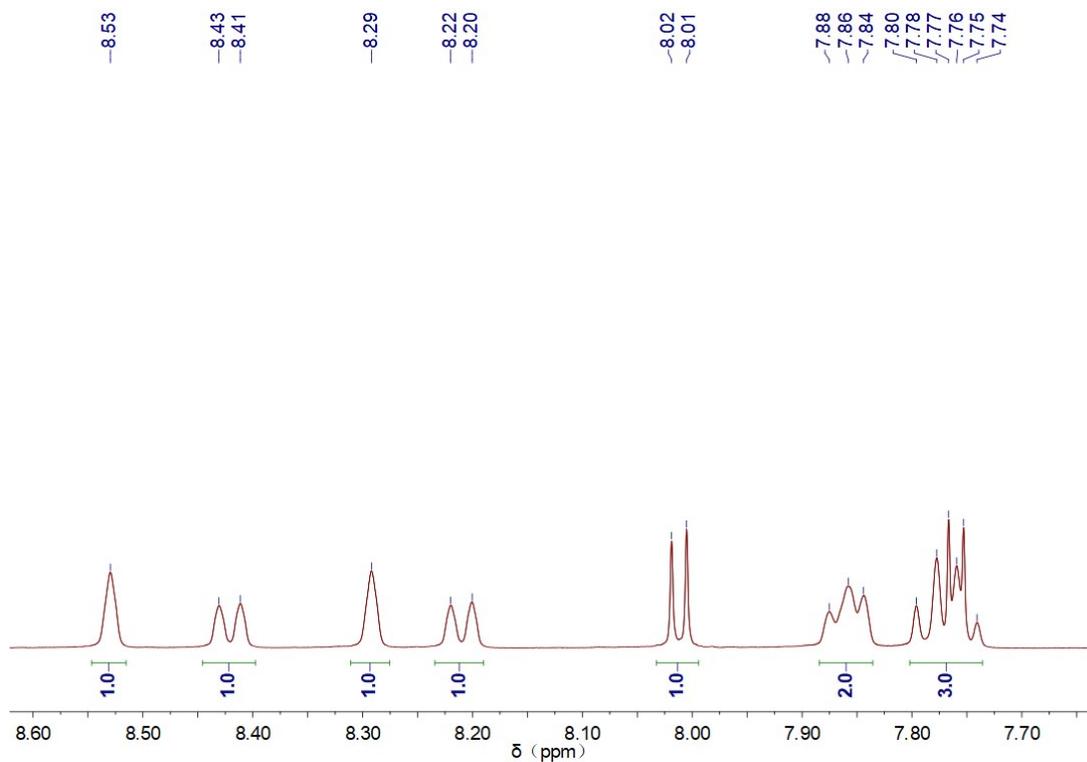

Sample	$\lambda_{\text{abs}}^{\text{a}}$ (nm)	λ_{em} (FWHM) ^a (nm)	λ_{em} (FWHM) ^b (nm)	k_{r}^{c} ($\times 10^5 \text{ s}^{-1}$)	k_{nr}^{c} ($\times 10^5 \text{ s}^{-1}$)
Ir1	256, 303, 383, 480	564(78)	563(74)	3.97 [3.17, 5.12]	1.46 [21.22, 0.69]
Ir2	261, 307, 361, 480	563(70)	561(73)	6.54 [4.20, 5.73]	0.81 [15.80, 0.12]
Ir3	310, 350, 414	534(77)	531(73)	2.98 [3.10, 4.87]	1.61 [5.52, 0.37]

[a] UV-Vis and photoluminescence spectra were recorded in CH_2Cl_2 at a conc. of 10^{-5} M. FWHM = full width at half maxima. [b] Photoluminescence spectra were recorded in PMMA at a conc. of 1 wt%. [c] The radiative/ irradiative decay rate constants ($k_{\text{r}}/k_{\text{nr}}$) of new iridium complexes in degassed CH_2Cl_2

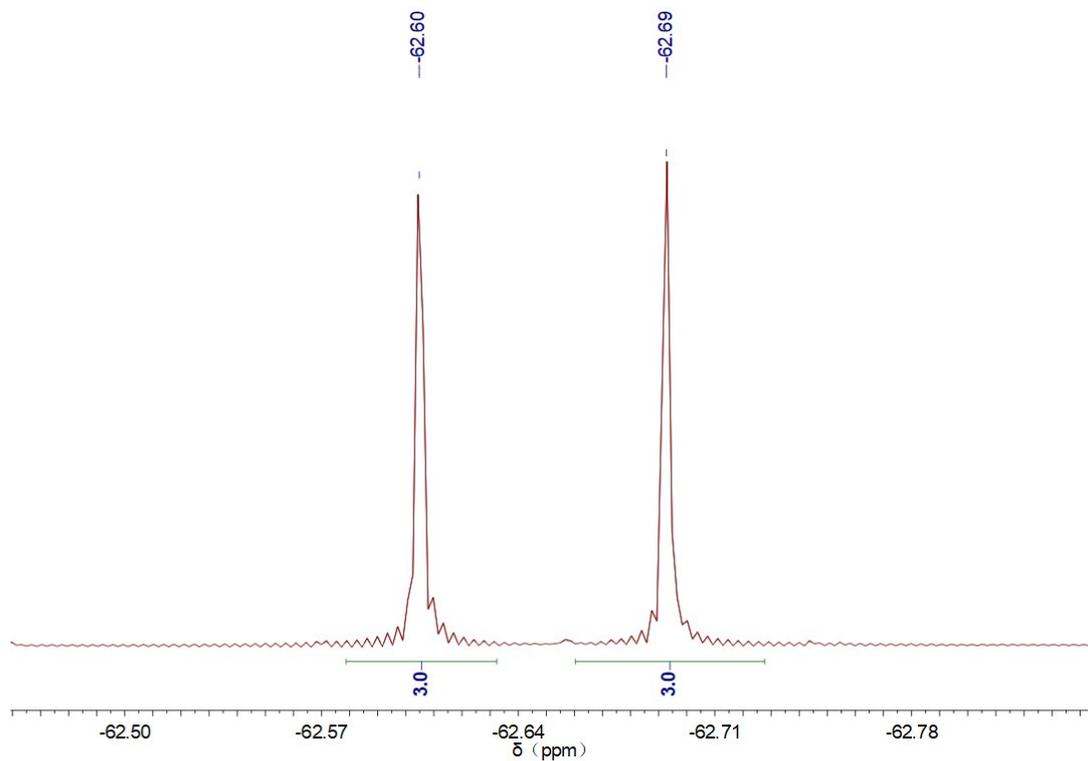

[aerated CH₂Cl₂, PMMA films at a conc. of 1 wt%] at RT, which are calculated by $k_r = \Phi/\tau_{\text{obs}}$ and $k_{nr} = 1/\tau_{\text{obs}} - k_r$.

4. ¹H- and ¹⁹F-NMR spectra of all new compounds.
