1. Crystalline Structures of FEFFIVE with Pyrazine organic linker

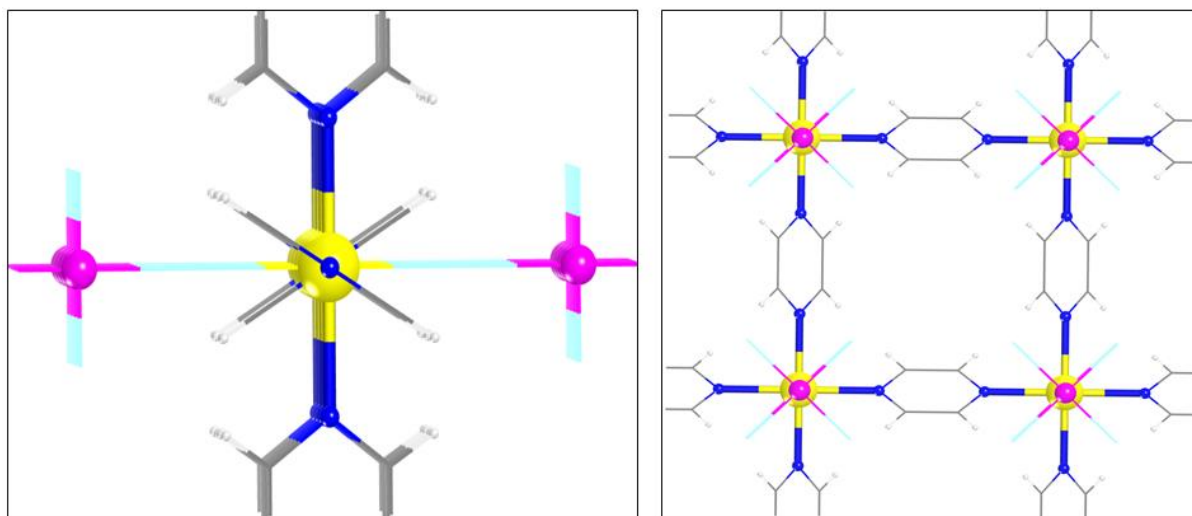

Fig. S1. Crystal structures extracted from experimental X-ray diffraction measurements for FEFFIVE-Ni-Pyr¹, unit cell (1×1×1) and super cell (2×2×2) viewed along c and direction, respectively. (Color code: Ni, yellow; Fe, violet; F, blue; C, gray; N, blue; H, white).

2. Microscopic models for the host [Ni (pyrazine)₂(FeF₅)_n] framework.

2.1. Optimization of dry crystal structure.

As consistent with the experimental assessment of the structural symmetry of the solid, the initial symmetry of [Ni(pyrazine)₂(FeF₅)_n] MOF corresponds to a tetragonal bipyramidal geometry¹. This MOF is optimized using PBE^{2,3} Density Functional Theory (DFT) functional by employing CP2K⁴⁻⁷ package. The electronic system customarily discussed with the help of Hubbard function.⁸ The GGA+U approach made an improvisation to describe the ground state of d-electron system^{9,10}. Additionally, used spin-unrestricted Kohn-Sham (UKS) method for the spin polarization to perform ligand-metal interaction.¹¹ This model is able to approximate the electron pair correlation function. The elements present in the MOF such as Carbon, Oxygen, Nitrogen, Fluorine and Hydrogen, a triple zeta (TZVP-MOLOPT)¹² basis set was considered, for the Iron and Nickel a double zeta (DZVP-MOLOPT)¹² was applied. The CUS-MOF [Ni(pyrazine)₂(FeF₅)_n] (here after FEFFIVE-Ni-pyr-TB) also compared with the previously optimized isostructure, [Ni(pyrazine)₂(AlF₅)_n], (hereafter ALFFIVE-Ni-pyr-TB)¹³. The optimized unit cell parameters for these structures are reported in Table S1.

Table S1. Cell parameters of FEFFIVE-Ni-pyr-TB and ALFFIVE-Ni-pyr-TB^{13,14}, obtained by DFT optimization (Dry case).

MOF	Lattice Size(Å)			Angle (°)			Cell volume (Å ³)	Energy (eV)
	a	b	c	α	β	γ		
FEFFIVE-Ni-Pyr-TB	7.007	7.007	7.929	90	90	90	389.298	-13721.91
ALFFIVE-Ni-pyr-TB ^{13,14}	6.901	6.901	8.015	90	90	90	381.705	-10416.85

2.2. Optimization of H₂O-loaded Crystalline [Ni(pyrazine)₂(FeF₅)_n]

The saturated water loading capacity for the [Ni(pyrazine)₂(FeF₅)_n] and [Ni(pyrazine)₂(AlF₅)_n] is ~22.0 wt% (i.e. 5 H₂O/u.c) and 15.85wt% (i.e. 3 H₂O/u.c) respectively as observed from the experimental water adsorption isotherm¹. The experimentally obtained saturated capacities of H₂O were randomly loaded into the optimized dry FEFFIVE-Ni-pyr-TB structure using Material Studio Software suite¹⁵ and further these H₂O-loaded structures were considered for geometry optimization. These simulations were performed using CP2K package⁴⁻⁷ at the DFT-level keeping the same functional and basis set used for the dry structure, where (i) the positions of both the atoms of the MOF framework and the H₂O molecules, and (ii) its cell parameters were fully relaxed. The trigonal bipyramidal geometry of FeF₅ is changed to square bipyramidal FeF₅H₂O upon the optimization of FEFFIVE-Ni-pyr-TB with saturated water. The DFT-optimized H₂O-loaded FEFFIVE-Ni-pyr-TB is denoted as FEFFIVE-Ni-pyr-SB. The optimized unit cell parameters and selected geometrical parameters for FEFFIVE-Ni-pyr-SB and its isostructural previously DFT-optimized ALFFIVE-Ni-pyr-SB¹⁴ structures are reported in Table S2 and S3. The atomic partial charges of all the atoms are calculated by using REPEAT method¹⁶ (Table S5). In addition to these water molecules per unit cell was progressively added into the FEFFIVE-Ni-pyr-TB models, and further optimized the 1, 2, 3, 4, 5 and 7 H₂O/u.c loaded FEFFIVE-Ni-pyr-TB with the same level of theory as used above.

Table S2. Cell parameters of H₂O loaded FEFFIVE-Ni-pyr-SB and ALFFIVE-Ni-pyr-SB obtained by DFT optimization.

MOF	Lattice Size(Å)			Angle ($^{\circ}$)			Cell volume(Å ³)	Energy (eV)
	a	b	c	α	β	γ		
FEFFIVE-Ni-Pyr-SB	7.063	7.063	7.888	90.00	90.00	90.00	393.501	-15599.69
ALFFIVE-Ni-py-SB ¹⁴	6.871	6.871	8.364	90.00	90.00	90.00	394.870	-11824.66

Table S3. Experimental and simulated bond length and unit cell dimensions.

Bond	FEFFIVE-Ni-pyr-SB	
	Experimental ¹ (Å)	Simulated (Å)
Fe-F _{equ}	1.937	1.618
Fe-F _{axial}	1.951	1.789
Ni-F _{axial}	2.034	2.145
Ni-N	2.107	2.080
Fe-O	1.890	1.604
C-H	0.930	1.060
a=b	9.892	7.063
c	7.971	7.888

Table S4. The possible distance of step by step of water loading optimized structure of FEFFIVE-Ni-pyr

No. of Water loaded in FEFFIVE-Ni-pyr	Distance of H _{H2O} -H _{organic} (Å)	Distance of O _{H2O} -N _{Pyrazine} (Å)	Distance of O _{H2O} -Fe (Å)
1H ₂ O	2.490	4.609	4.412
2H ₂ O	2.530	4.317	4.392
3H ₂ O	3.080	4.392	3.419
4H ₂ O	1.470	2.722	3.728
5H ₂ O	1.537	2.347	1.604
6H ₂ O	1.483	3.735	1.703
7H ₂ O	1.508	3.755	1.717

Table S5. Atomic partial charges of FEFFIVE-Ni-pyr-TB structure

Atomic types	C1a	C2a	F1	F2	H1a	H2a	Ni	N1a	Fe
Charge (e)	-0.121	-0.125	-0.401	-0.372	0.168	0.169	0.099	-0.111	1.899

3. Pore size distribution, pore volume, specific surface area calculations.

The pore size distributions (PSD)¹⁷ of optimized FEFFIVE-Ni-pyr and ALFFIVE-Ni-pyr with and without H₂O loaded were calculated by Gelb and Gubbins¹⁸ methodology, as shown in Fig. S2. Moreover, internal surface area and pore volume is taken to account. In which the internal surface area calculated through the random selection and checking the point of overlap. While the estimation of pore volume based on the insertion of a random point and checking the overlap and fractionalized with the total attempted movement. These strategies are outline through Gelb and Gubbins¹⁸ methodology (Table S6).

Table S6. Surface area and Pore volume of MFFIVE-Ni-pyr-TB/SB M=FE/AL.

	FEFFIVE-Ni-pyr-TB	ALFFIVE-Ni-pyr-TB	FEFFIVE-Ni-pyr-SB	ALFFIVE-Ni-pyr-SB
Surface Area(m ² /g)	1034.5	1032.4	1549.9	1947.8
Pore volume(cc/g) (Free volume)	0.1470	0.1462	0.1810	0.2399

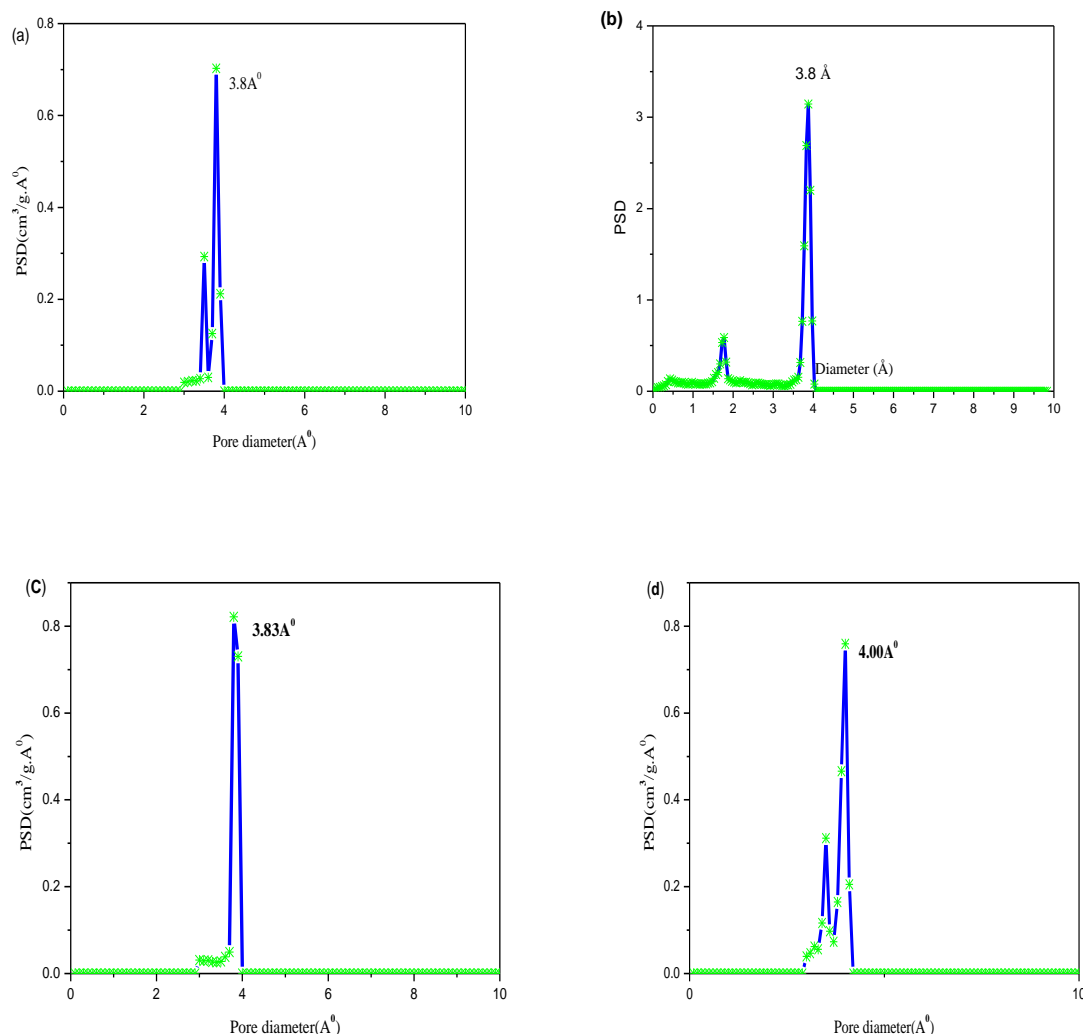

Fig. S2. Pore size distributions for optimized structures of dry (a) FEFFIVE-Ni-pyr-TB (b) ALFFIVE-Ni-pyr-TB and H₂O loaded structure of (c) FEFFIVE-Ni-pyr-SB and (d) ALFFIVE-Ni-pyr-SB.

4. Interatomic Potentials (Generic Force field).

Initially, the overall interaction between the MOFs and guest molecules were modelled via combination of Lennard-jones and coulombic term (reported in Table S7). The LJ parameters are clarified by using Universal force field (UFF)¹⁹ and DREIDING²⁰ potentials for respective inorganic and organic part of the atoms in the MOF framework, except for Al which is considered from Faro et al.¹³. In this work, CO₂ adsorbate models were initially considered by EPM2²¹, EPM²¹, TraPPE²² intermolecular potential, N₂ by TraPPE²², MOM²³ and Murad et al three site model²⁴ and H₂O by TIP4P2005^{25,26}, TIP4PEw²⁷, SPCE²⁸, TIP5P²⁹ and TIP4P³⁰ respectively.

Table S7. LJ potential parameters for the atoms of the MFIVE-Ni-pyr series.

Atomic type	LJ	
	σ (Å)	ε / k_B (K)
C	3.473	47.857
H	2.846	7.649
N	3.662	34.724
F	3.093	38.975
Ni	2.8340	7.5483
Fe	2.9120	6.5419
Al	1.447	108.998

Table S8. Potential parameters and partial charges for the adsorbates

	M_e	0.0	0.0	-1.04

6. GCMC Simulations.

Grand Canonical Monte Carlo (GCMC) simulations were carried out to predict the single component adsorption of gases, H₂O, CO₂ and N₂, and co-adsorption of CO₂/N₂ and CO₂/N₂/H₂O in all the DFT-optimized structures, FEFFIVE-Ni-pyr-TB, ALFFIVE-Ni-pyr-TB, FEFFIVE-Ni-pyr-SB, and ALFFIVE-Ni-pyr-SB, at 298 K by employing the RASPA³¹ simulation code. We also conducted ternary adsorption of H₂O/CO₂/N₂, in which simply assume that N₂ does adsorb negligibly at these conditions from their bulk mole fraction (85%). Our simplified flue gases are at total pressure of 1.0 bar at temperature of 298 K with a range of H₂O mole fraction varying from 0.001% to 0.5%. (E.g. 0.01% H₂O, 14.99% CO₂, and 85% N₂ at 1 bar, T = 298 K) with various adsorbate models. The simulation boxes were made of (4×4×4) 64 unit cells. In the guest-host interaction the short range dispersion force define through LJ potential and long range electrostatic interaction via Ewald summation technique. The LJ is truncated and lifted to zero by 12 Å. In the given thermodynamic conditions the fugacities of adsorbed species are calculated through Peng- Robinson equation of states (EoS)³². For each state point, 2×10^8 and 5×10^7 Monte Carlo steps have been employed for equilibration and production runs, respectively. Three types of trials were considered for the molecules: (i) translation or rotation, (ii) creation / deletion and (iii) exchange of molecular identity. In addition to this, the translation and rotation Monte Carlo steps were only allowed for pre-loaded H₂O during the GCMC simulation for simulated co-adsorption under pre-humidified conditions. The adsorption enthalpy at low coverage (Δh) for each gas was calculated through configurational-bias Monte Carlo simulations performed in the NVT ensemble using the revised Widom's test particle insertion method.³³

6.1 Adsorbent selection criteria

There is a number of benchmarks are available to determine the characteristic and performance of an adsorbent in the adsorption process, currently we chosen selectivity (S) of CO₂ over N₂, working capacity (ΔN) and Adsorption Performance Indicator (API) to account the adsorbent performance.

In this work, selectivity of CO₂ over N₂ with the mole fraction of flue gases in power plant is used (15 % CO₂ and 85 % N₂),

$$S(\text{CO}_2/\text{N}_2) = (x_{\text{CO}_2}/x_{\text{N}_2}) (y_{\text{N}_2}/y_{\text{CO}_2}) \quad (1)$$

Where x_{CO_2} and x_{N_2} represents the mole fraction of CO_2 and N_2 in the adsorbed phase and y_{N_2} and y_{CO_2} represents the mole fraction of N_2 and CO_2 in bulk phase respectively. The calculated selectivity's are shown in the TableS9.

One of the important parameter used in the basic application of selecting the adsorbent is carried out mainly via on working capacity (ΔN)^{34,35}. It is determined through the distinction of gas uptake at the stage of high pressure (N_H) and lower pressure (N_L), generally expressed as the unit of cc/cc adsorbent (Table S10).

$$(\Delta N) = N_H - N_L \quad (2)$$

Moreover, one of the significant parameter known as Adsorption Performance Indicator (API) proposed by Wiersum et al.³⁵ to analyse the performance in MOFs,

$$API = (S_{12} - 1)^A * \frac{\Delta N^B}{\Delta H^C} \quad (3)$$

Where the S_{12} corresponds to the selectivity of highly adsorbed to least adsorbed, ΔN is the working capacity of highly adsorbed species and ΔH terms the average enthalpy of adsorbed species. Here all the A, B, C components used to be one, because of the objective of separation.

7. Comparison of the single component isotherms in dry MFFIVE-Ni-pyr-TB (M=FE/AL).

10. Separation of CO_2/N_2 mixture in presence of humidity by utilizing generic force field.

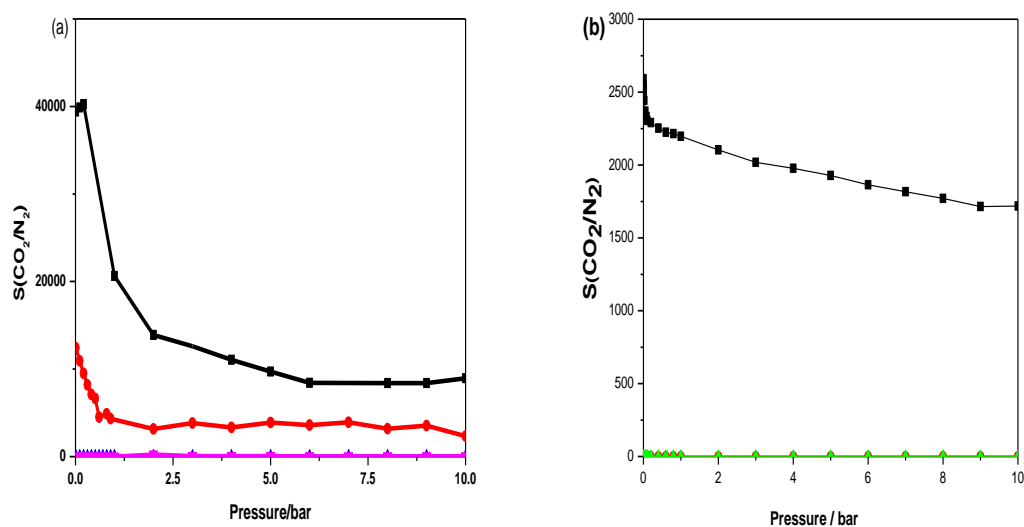

Fig. S20. Simulated selectivity's for CO_2/N_2 from their 15/85 molar ratio gas mixture in DFT-optimized H_2O -loaded structures utilizing generic force field (TIP4P), (a) FEFFIVE-Ni-pyr-SB, (b) ALFFIVE-Ni-pyr-SB (water loaded = 4.871 %, square; 9.7427%, circle; 14.6141%, up-triangle; 19.4855%, diamond).

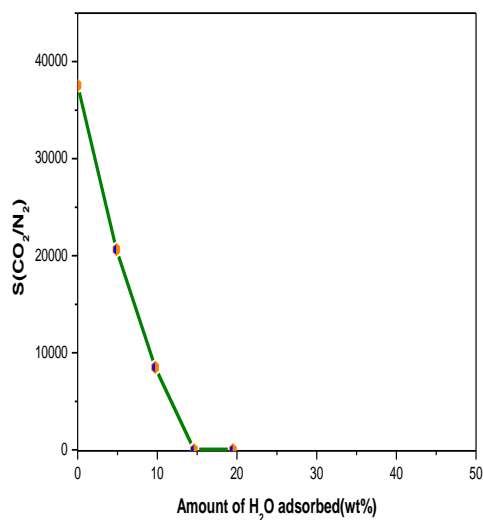

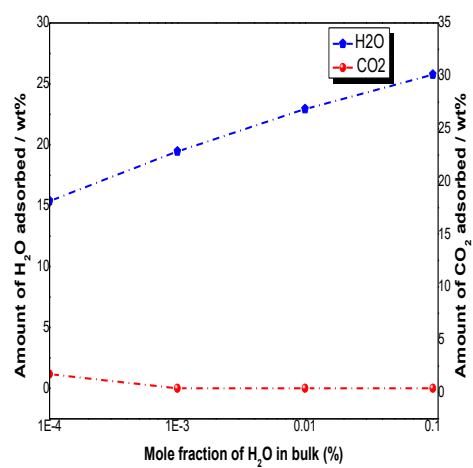

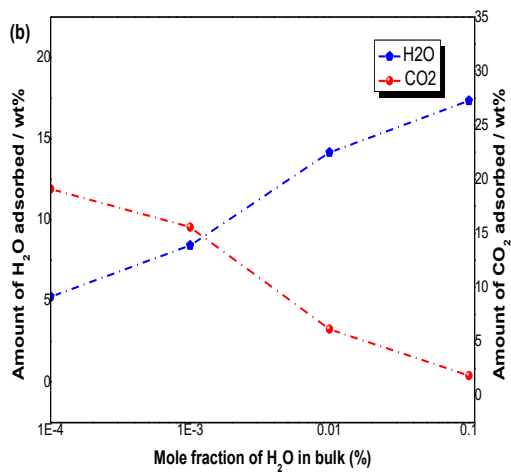

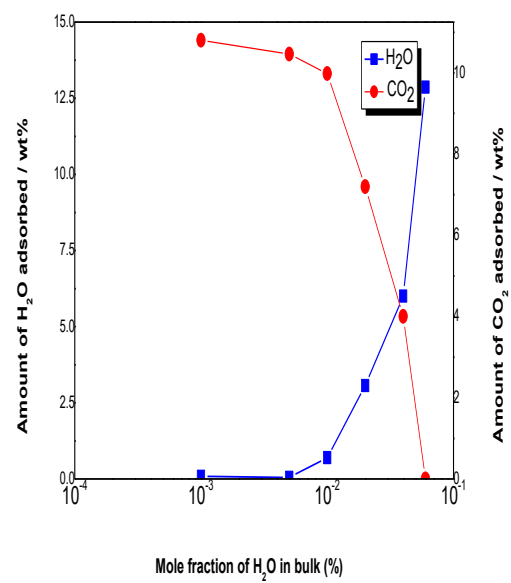

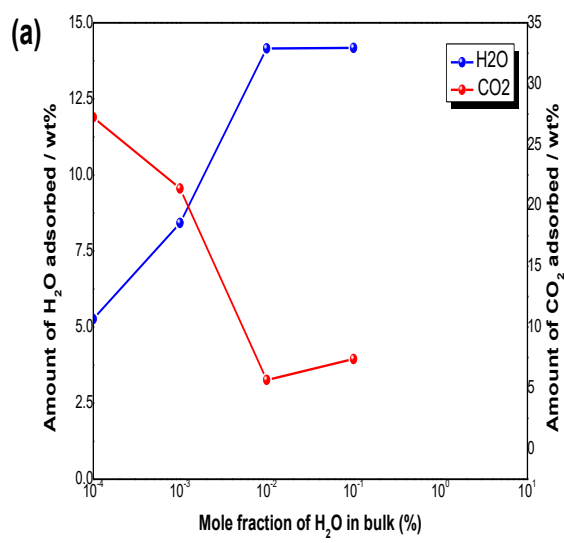

Fig. S21. Simulated selectivity for CO_2/N_2 from their 15/85 molar ratio gas mixture in DFT-optimized H_2O -loaded structure of FEFFIVE-Ni-pyr-SB utilizing generic force field, (water loaded = 0%, 4.871%, 9.7427%, 14.6141%, 19.4855%).

11. Ternary adsorption involves H_2O , CO_2 and N_2 using Generic Force Field

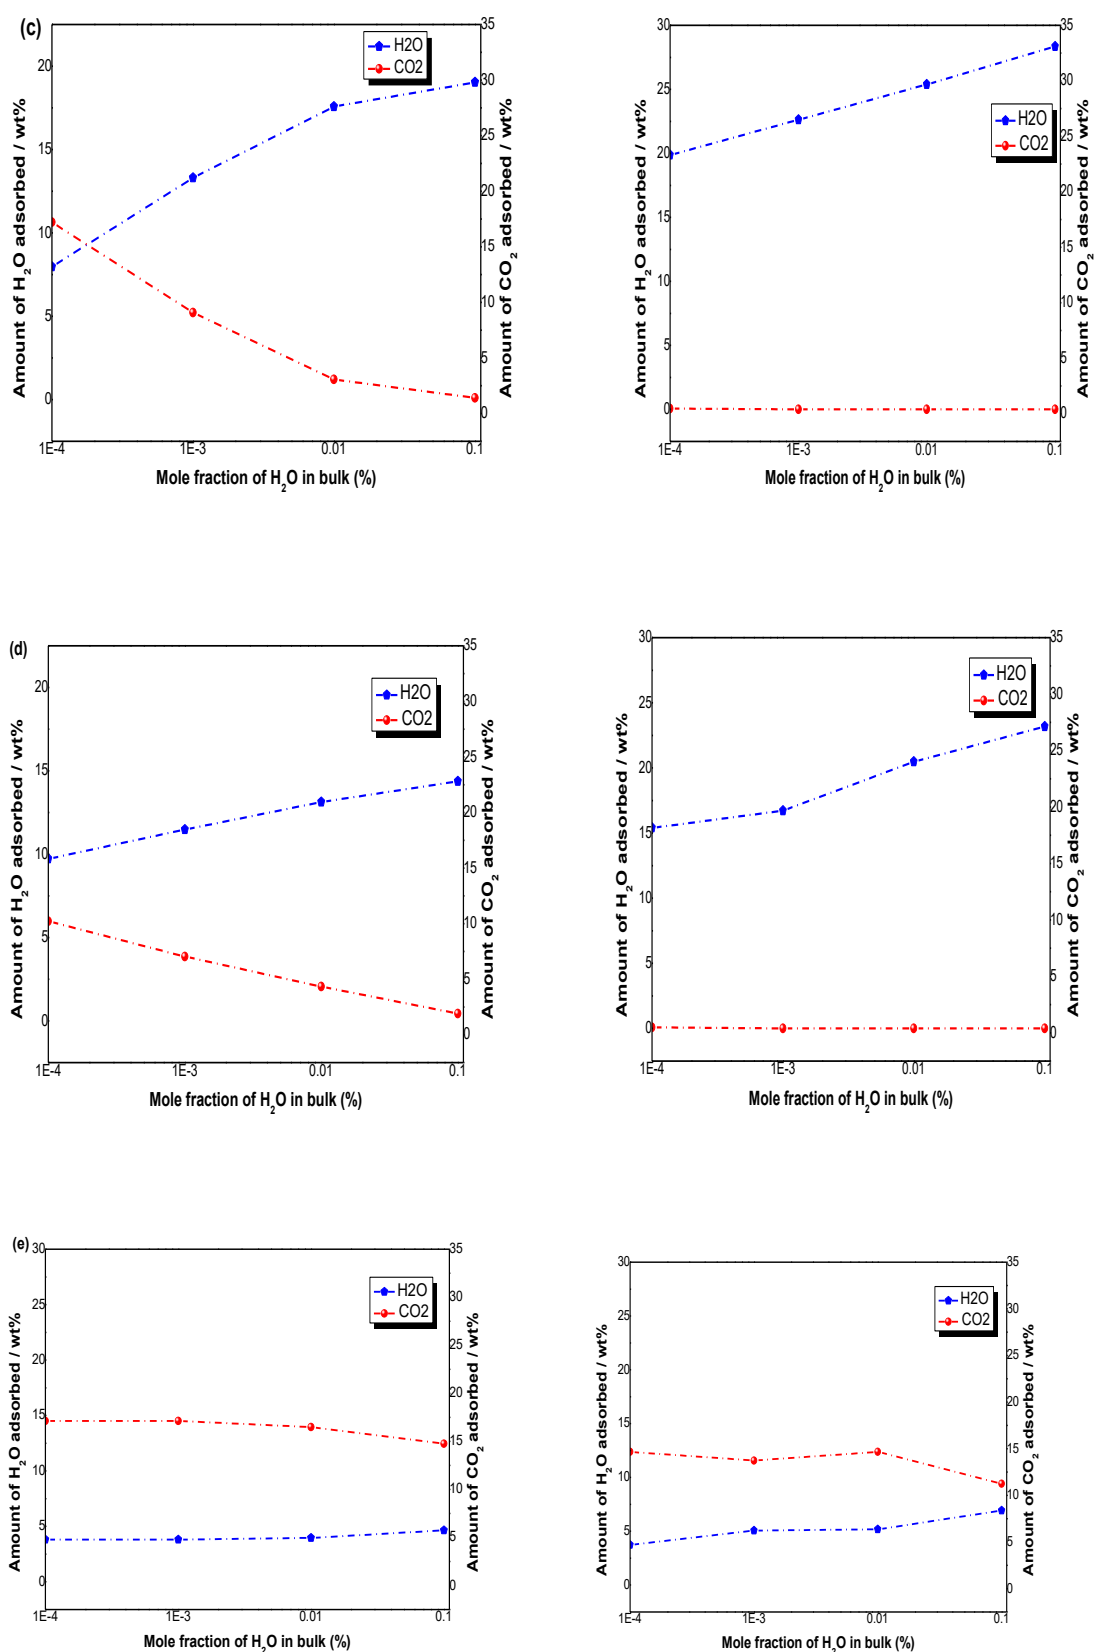

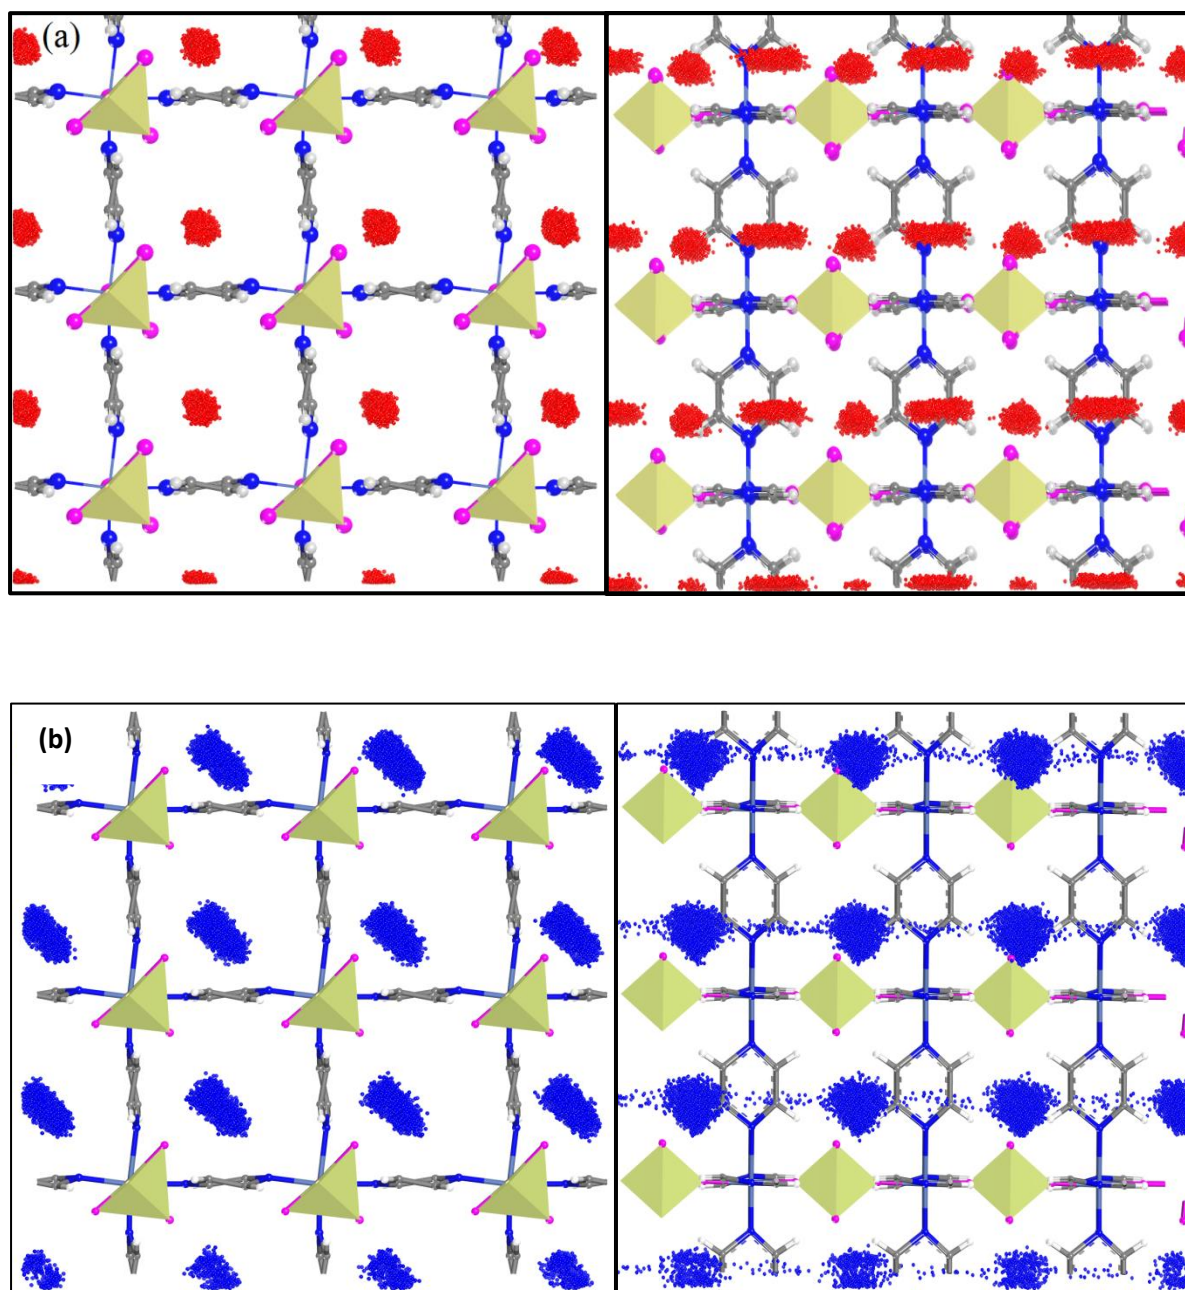

Fig. S22. Simulated Ternary adsorption for H₂O,CO₂ and N₂ in FEFFIVE-Ni-pyr-SB (left) and ALFFIVE-Ni-pyr-SB (right) using generic forcefield as a function of H₂O mole fraction at

total pressure of 1.0 bar and temperature of 298 K. Uptake of H₂O (Left y-axis, closed blue squares) and CO₂ (Right y-axis, red closed circles) with adsorbate model: H₂O/CO₂/N₂ as (a) TIP4P/EPM2/TraPPE, (b) TIP4P2005/EPM2/TraPPE, (c) TIP4PEw/EPM2/TraPPE, (d) TIP5P/EPM2/TraPPE and (e) TIP4PEw/TraPPE/TraPPE.

12. Snapshot of loaded guest molecule in FEFFIVE-Ni-pyr-SB

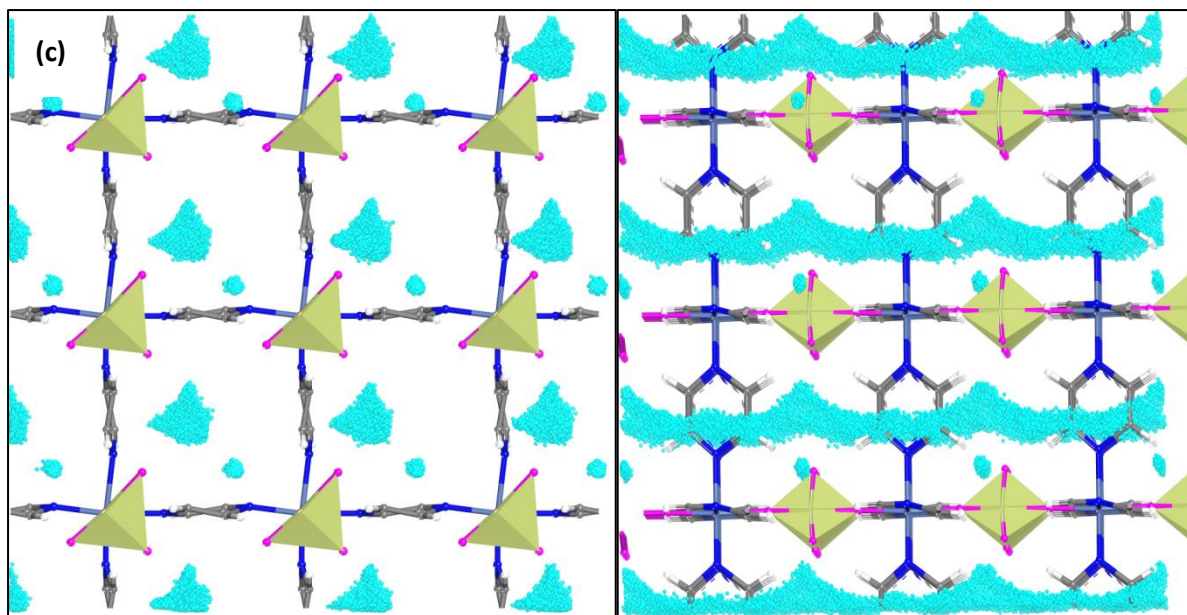

Fig. S23. Maps corresponding occupied positions of CO₂ (red), N₂ (blue) and H₂O, (with 19.5 wt %), (cyan) in 1000 equilibrated frames extracted from the GCMC simulations of FEFIVE-Ni-pyr-SB utilizing generic force field.

13. GCMC Simulations – Using DFT-Derived Force field.

Interatomic potentials for describing the interaction between the adsorbate and CUS MOF framework in presence of humidity were derived by Quantum mechanically. Therefore, the extra potentials for Fe-H₂O are derived from DFT energy profile for the interaction between H₂O and Fe of MFFIVE-Ni-pyr-SB (M=Fe/Al). Where, the binding energy were calculated as follows,

$$E_{B.E} = E_{MOF+Guest} - E_{MOF} - E_{Guest} \quad (4)$$

Where $E_{(MOF + Guest)}$ corresponds to the energy of optimized metal organic framework with loaded guest molecule and E_{MOF} and E_{Guest} indicates the energy of MOF and guest molecule individually. From the series of binding energy calculations by varying the Fe-adsorbate interatomic distance from 0.1 to 5 Å leads to the potential energy curve of Guest-host interaction in the system. The potential energy curve further evaluates for the derivation of new force field parameters to represent guest-host interaction. Grand canonical Monte Carlo (GCMC) was performed to determine the single component adsorption and adsorption enthalpy of guest molecule such as CO₂, N₂ and H₂O at 298K. Additionally binary adsorption, adsorption in presence of water and ternary were performed carefully.

13.1 Interatomic Potential parameters- DFT-Derived FF.

The interaction between guests molecules with MFFIVE-pyr-SB (M=Fe/Al) framework were explained through Vander Waals contribution, however two more analytical functions are employed to address Vander Waals term

- (a) The interaction between any guest molecules with all atoms of the frameworks except open metal site of Fe/Al using standard 12-6 Lennard Jones potential (LJ).(equation5)

$$U_{ij} = \underbrace{\sum_{i < j} \frac{1}{4\pi\epsilon_0} \frac{q_i q_j}{r_{ij}}}_{\text{Electrostatic term}} + \underbrace{4\epsilon_{ij} \left[\left(\frac{\sigma_{ij}}{r_{ij}} \right)^{12} - \left(\frac{\sigma_{ij}}{r_{ij}} \right)^6 \right]}_{\text{Lennard-Jones term}} \quad (5)$$

Lennard-jones parameters are defined through Universal Field Parameters (UFF)¹⁹ and DREIDING²⁰ generic fields for the inorganic and organic part of MOF framework, respectively. ϵ_{ij} and σ_{ij} indicates the interacting pair LJ parameter and the interaction parameters obtained through Lorentz-Berthelot mixing rules.(i.e., a geometric combining rule for the energy and an arithmetic one for the atomic size: $\epsilon_{ij} = (\epsilon_i \epsilon_j)^{1/2}$ and $\sigma_{ij} = (\sigma_i + \sigma_j)/2$). The second term is the Columbic contribution between point charges q_i and q_j separated by a distance r_{ij} .)

- (b) The interaction between open metal site, Al/Fe, and guest molecule through Buckingham analytical function³⁶.(equation 6)

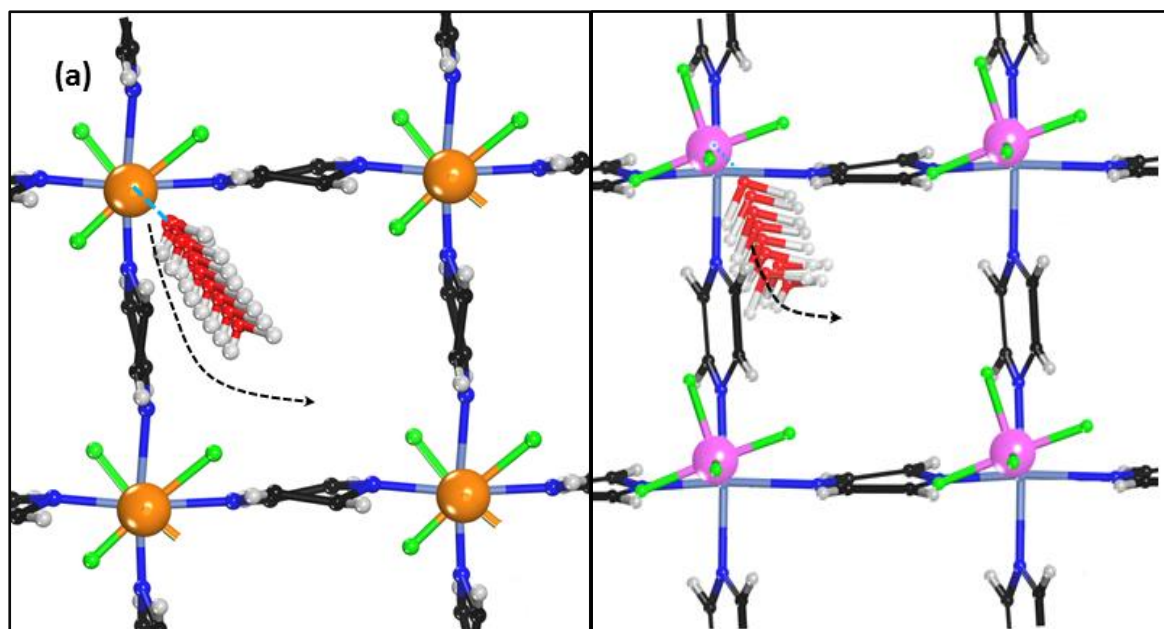

$$U_{ij} = \underbrace{\sum_{i < j} \frac{1}{4\pi\epsilon_0} \frac{q_i q_j}{r_{ij}}}_{\text{Electrostatic term}} + \underbrace{\left[A_{ij} e^{-B_{ij} r_{ij}} - S_g \frac{C_{ij}}{r_{ij}^6} \right]}_{\text{Buckingham term}} \quad (6)$$

A, B and C are the conventional Buckingham parameters for repulsive and attractive contribution respectively and S_g indicates the global scaling factor for the dispersion energies. The DFT derived energy profile represented in Fig.S18 and S19 detailed as below.

Table S9: Buckingham parameters associated with the Fe/Al (III)-CUS-MOF with Adsorbates.

Adsorbates	Buckingham Parameters		
	A(kJ/mol)	B(A ⁰) ⁻¹	C(kJ mol ⁻¹ A ^{0 6})
Fe-Oe	7.06×10^8	10.19	558.556
Fe-C_CO ₂	3.34×10^6	2.57	192.06×10^3
Fe-O_CO ₂	1.11×10^7	2.66	114.41×10^4
Fe- N ₂	7.58×10^4	3.67	1000
Al-Oe	8.87×10^5	3.63	5774
Al-C_CO ₂	9.69×10^6	8.5	273.69×10^3
Al-O_CO ₂	9.62×10^6	10.3	739.13×10^2
Al- N ₂	9.68×10^5	8.79	820

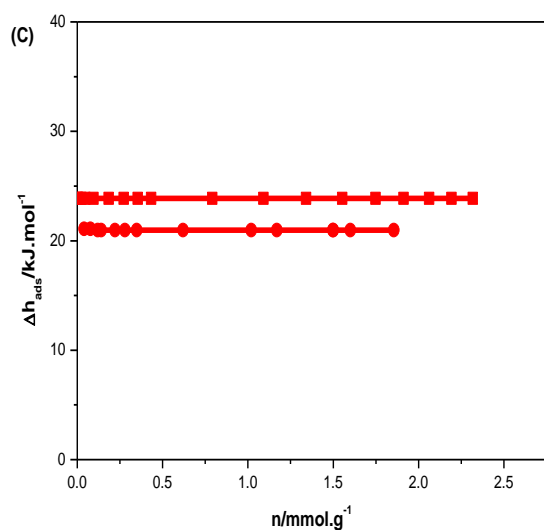

Fig. S28. Simulated enthalpy of adsorption with DFT-Derived FF for H₂O (a) CO₂ (b) and N₂ (c) in FEFFIVE-Ni-pyr-SB (square) and ALFFIVE-Ni-pyr-SB (sphere) at 298K

16. Co-adsorption – CO₂ adsorption in wet structures using newly DFT-Derived FF.

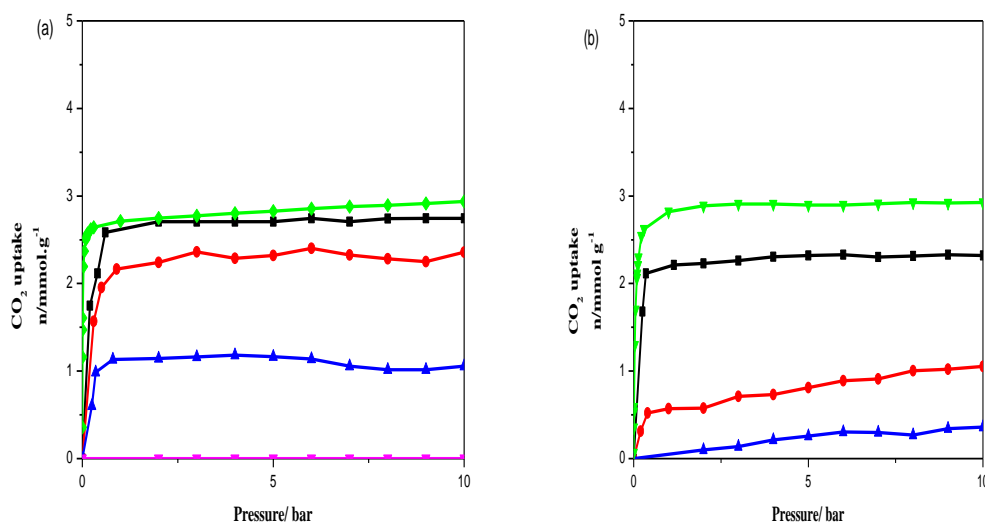

Fig. S29 : Simulated co-adsorption isotherm for CO₂ in presence of various concentration of water, (a) FEFFIVE-Ni-pyr-SB and (b) ALFFIVE-Ni-pyr-SB using newly DFT-derived FF (RH = 0%, green; 4.871%, black; 9.7427%, red; 14.6141%, blue; 19.4855%, violet, 24.343%, pink)

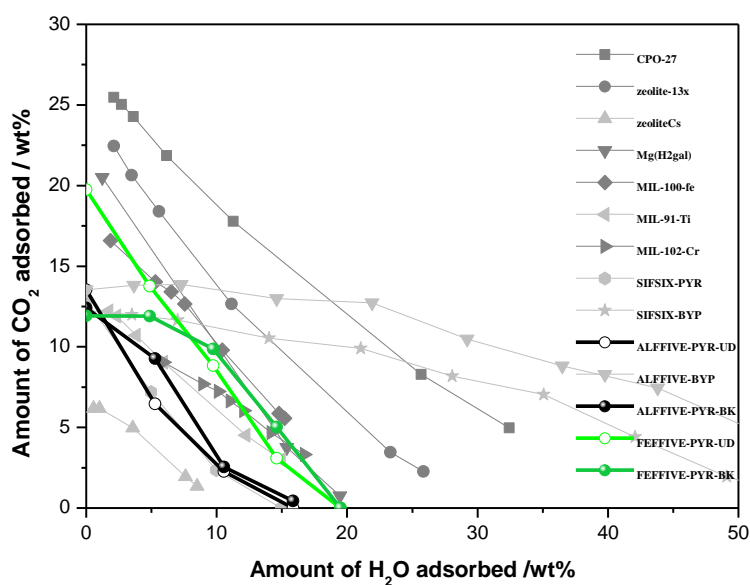

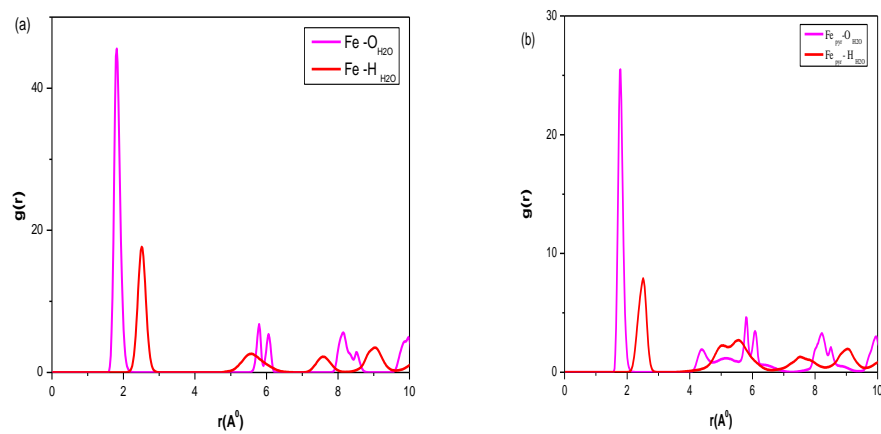

Fig. S30. Evolution of CO₂ uptake as a function of the amount of pre-adsorbed water on a series of MOFs.^{14,37} (Green colour specify the present work)

16.1. Radial Distribution Functions calculated for single component adsorption using DFT-derived FF.

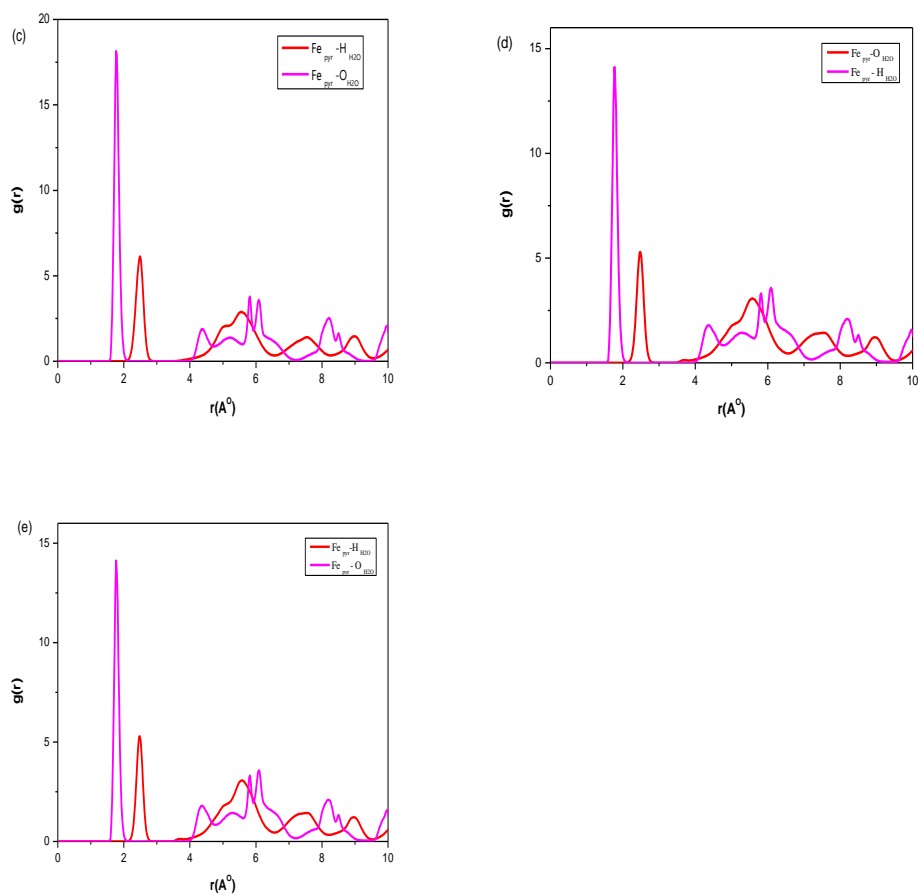

Fig. S31. Radial distribution functions (RDF) between guest molecules (H_2O) and the atoms of the framework in FEFFIVE-Ni-pyr-SB with DFT-derived FF. (RH=4.871 %, (a); 9.7427%, (b); 14.6141%, (c); 19.4855%, (d); 24.343%, (e)).

17. Separation of CO_2/N_2 mixture in presence of humidity using DFT-derived FF.

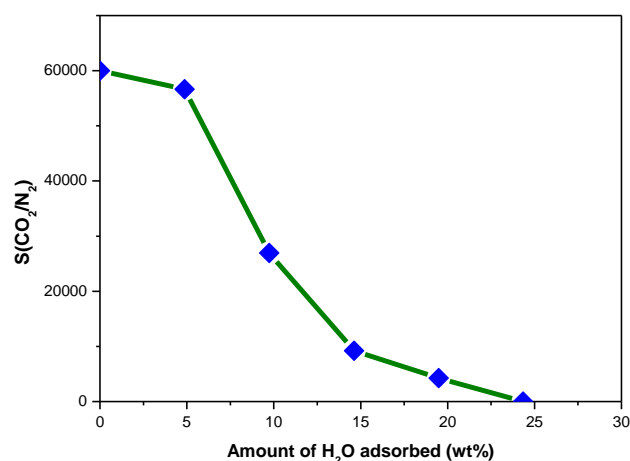

Fig. S32. Simulated selectivity's for CO₂/N₂ with 15/85 molar ratio gas mixture in FEEFFIVE-Ni-pyr-SB using newly DFT-Derived FF.

18. Ternary adsorption utilizing DFT-derived FF involves H₂O, CO₂ and N₂

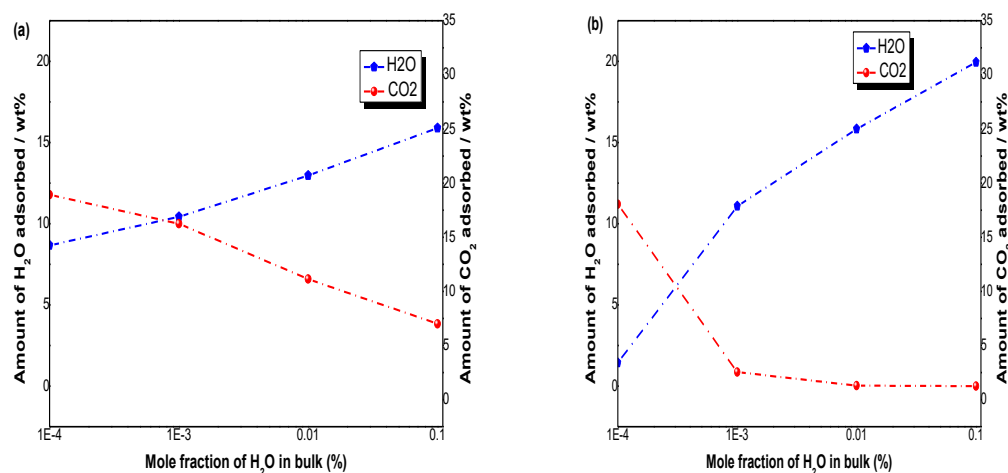

Fig. S33. Ternary co-adsorption for the flue gas composition, H₂O, CO₂ and N₂, in FEEFFIVE-Ni-pyr-SB (a) and ALFFIVE-Ni-pyr-SB (b) by using newly DFT-derived FF. Uptake of H₂O (Left y-axis, closed blue squares) and CO₂ (Right y-axis, red closed circles) as a function of H₂O mole fraction at total pressure of 1.0 bar and temperature of 298 K.

18.1 Comparison of Radial Distribution Function of adsorbate interaction.

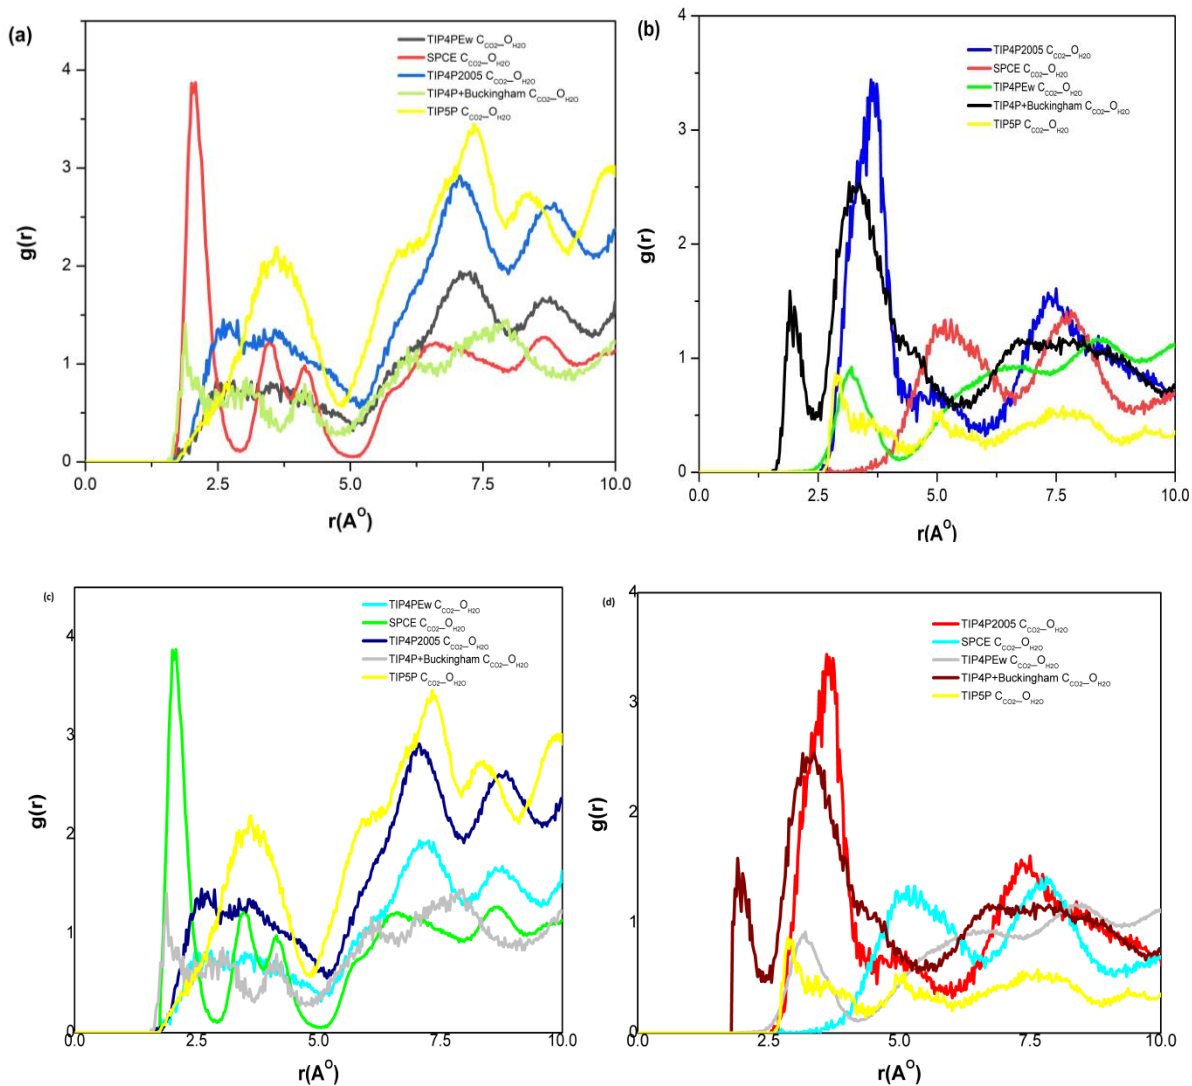

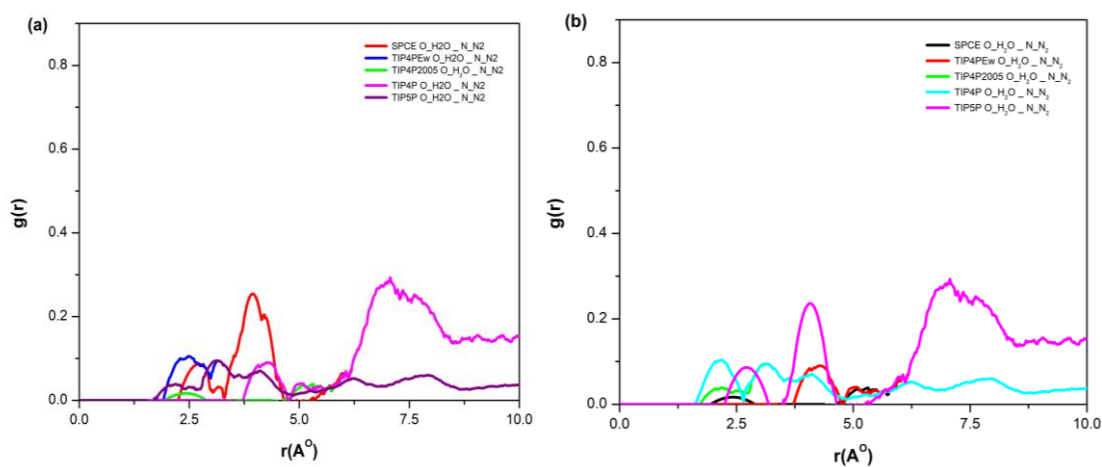

Fig. S34: Radial distribution functions (RDF) between guest molecules (H_2O) having different models and CO_2 model for FEFFIVE-Ni-pyr (left) and ALFFIVE-Ni-pyr (right) at 1 bar (a, b) and 10 bar (c, d).

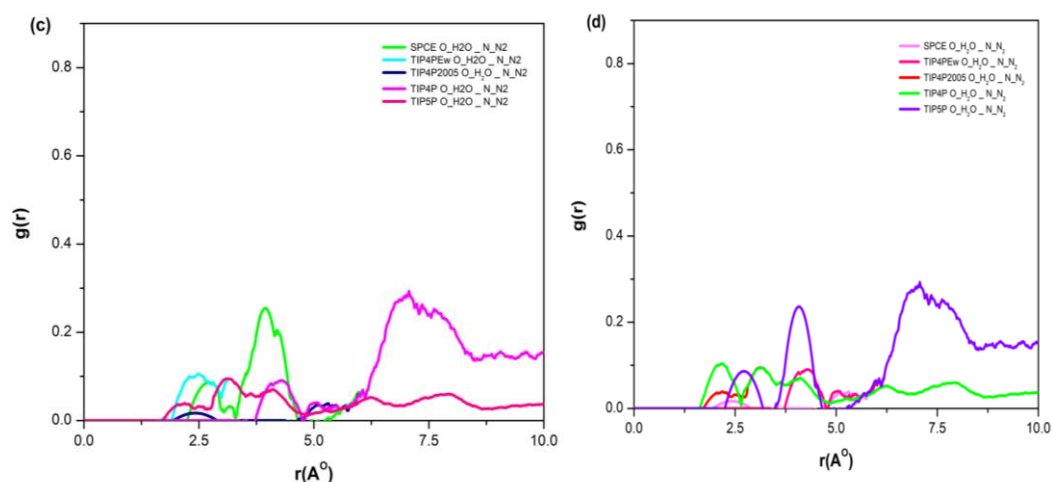

Fig. S35: Radial distribution functions (RDF) between guest molecules (H_2O) having different models and N_2 (TraPPE) model for FEFFIVE-Ni-pyr (left) and ALFFIVE-Ni-pyr (right) at 1 bar (a, b) and 10 bar (c, d).

Table S10. Comparison of CO_2 / N_2 selectivity for a series of MOFs and conventional adsorbents in dry conditions at 1 bar and 298-303K.
