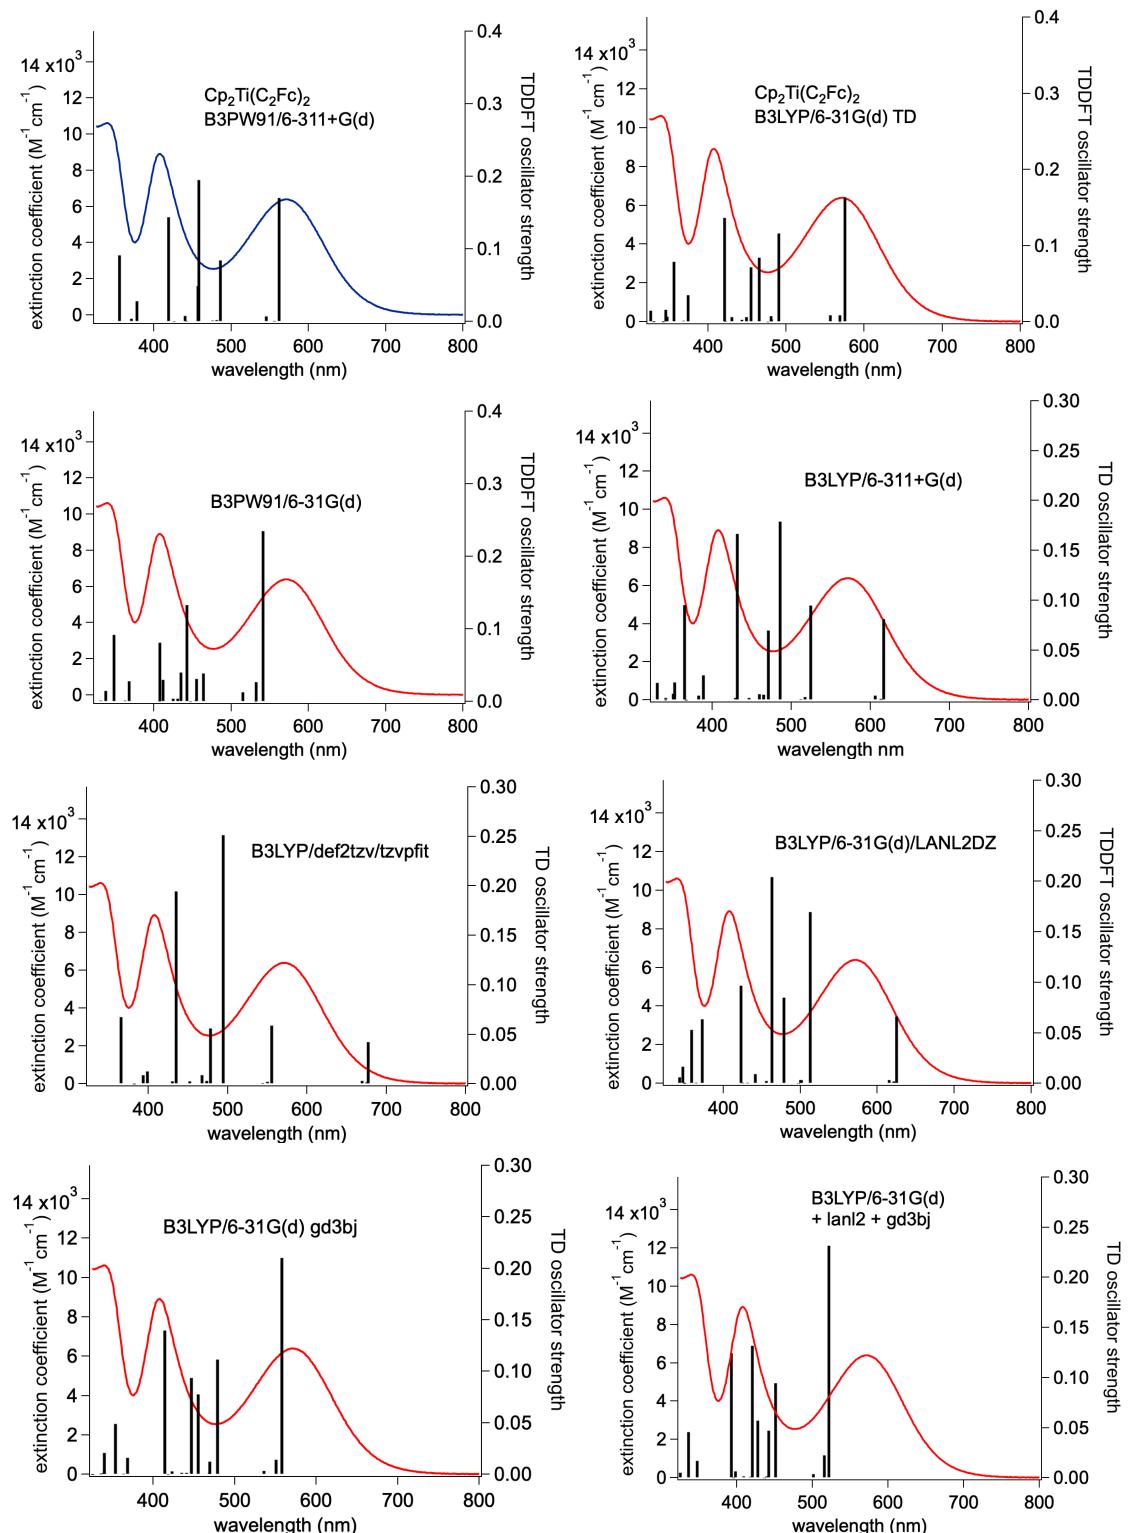

Figure S1. Overlay of experimental spectra and TDDFT predicted vertical transitions and oscillator strengths for various computational models. All computational models utilize solvent=thf. Optimization and TDDFT were performed within the same computational model.

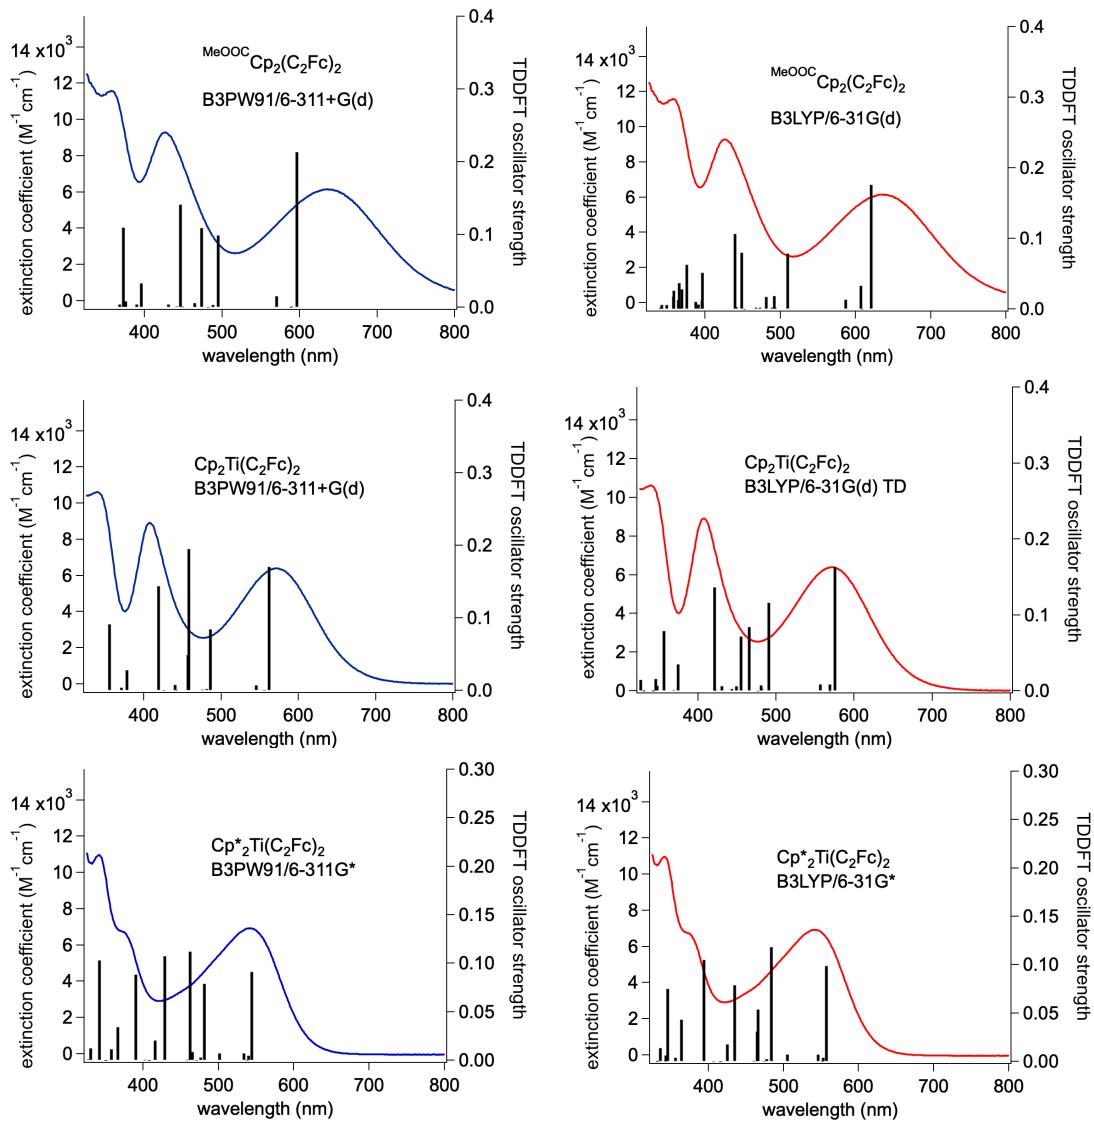

Figure S2. Overlay of experimental spectra and TDDFT predicted vertical transitions and oscillator strengths (B3PW91/6-311+G(d) (left) vs B3LYP/6-31G(d) (right)) for $\text{MeOOC-Cp}_2\text{Ti}(\text{C}_2\text{Fc})_2$ (top), $\text{Cp}_2\text{Ti}(\text{C}_2\text{Fc})_2$ (middle), and $\text{Cp}^*_2\text{Ti}(\text{C}_2\text{Fc})_2$ (bottom). Comparison of. The experimental spectra were recorded in THF. Optimization and TDDFT employed a THF solvent model.

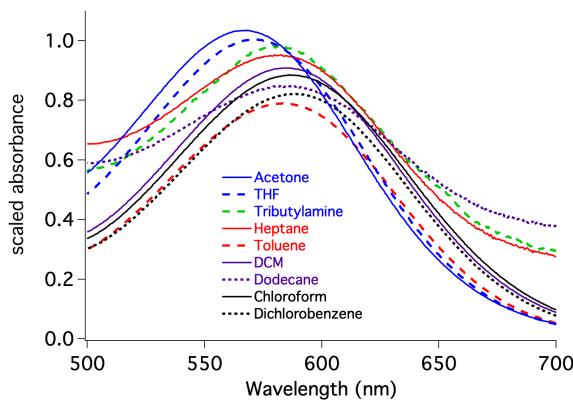

Figure S3. Solvatochromic data for remaining solvents not shown in manuscript Figure 5 for $\text{Cp}_2\text{Ti}(\text{C}_2\text{Fc})_2$. Absorbance is scaled to allow observation of all peaks.

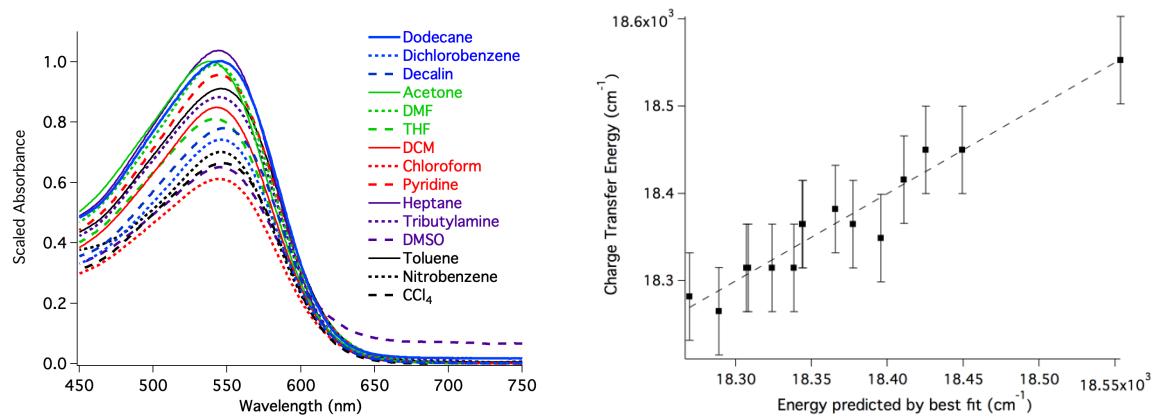

Figure S4. Solvatochromic data (left) for $\text{Cp}^*_2\text{Ti}(\text{C}_2\text{Fc})_2$ along with a representation of the goodness of fit to equation 1 (right). Absorbance is scaled to allow observation of all peaks. Wavelengths recorded in manuscript Table 1.

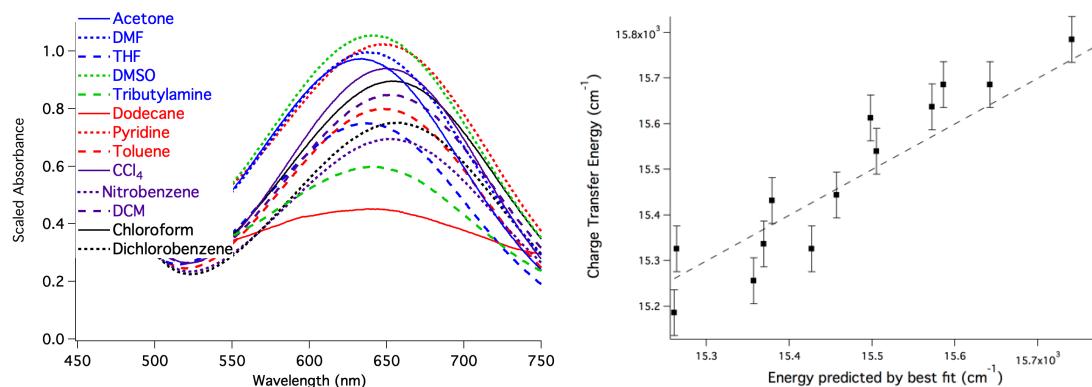

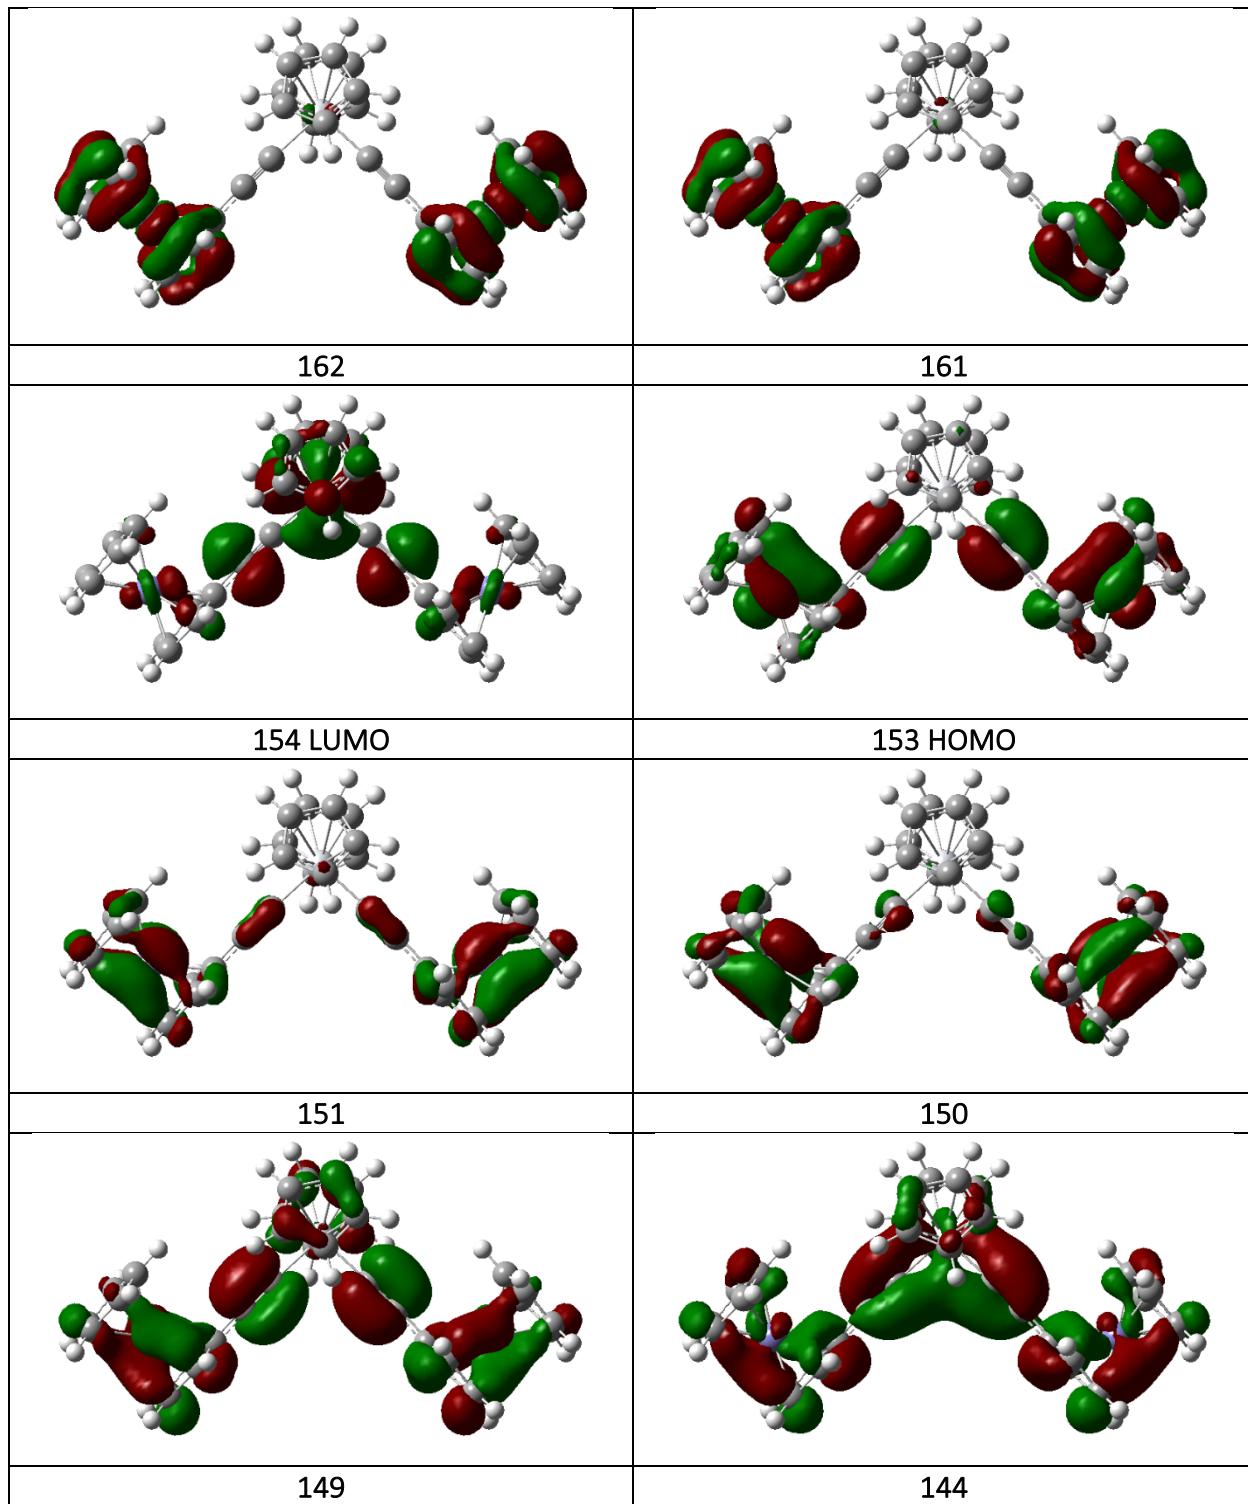

Figure S5. Solvatochromic data (left) for $\text{MeOOC-Cp}_2\text{Ti}(\text{C}_2\text{Fc})_2$ along with a representation of the goodness of fit to equation 1 (right). Absorbance is scaled to allow observation of all peaks. Wavelengths recorded in manuscript Table 1.

Table S1. TDDFT output for key excited states for Cp₂Ti(C₂F_c)₂

Excited State	1:	Singlet-A	2.1531 eV	575.83 nm	f=0.1641	<S**2>=0.000
