Experimental section

**Materials:**

Pyrene, 1,5-cyclooctadiene (cod), bis(1,5-cyclooctadiene)nickel (Ni(cod)₂), bis(1,5-cyclooctadiene)dimethoxydiiridium, 2,2′-bipyridyl, N,N-dimethylformamide (DMF), tetrahydrofuran, N-methyl pyrrolidone (NMP), CuBr₂, ZnCl₂, and Zinc foil (0.1 mm thick) were purchased from Acros, Alfa, TCI, and Aldrich, and they were used as received. Hexane, ethyl acetate, dichloromethane, methanol, ethanol and acetone were purchased from Sinopharm. Glass fiber (GF/D borosilicate) was purchased from Whatman. Carbon paper was purchased from Fuel Cell Store. The compounds of 1,3,6,8-tetrabromopyrene, 2,7-dibromopyrene, 1,3,6,8-tetrakis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyrene and 1,6-dibromopyrene were prepared according to the literatures.¹⁻⁴

**Methods:**

*Synthesis of LPy-1:* Under the protection of N₂, 1,5-cyclooctadiene (1.01 mL, 8 mmol) was added into the solution of bis(1,5-cyclooctadiene)nickel (2.15 g, 7.8 mmol) and 2,2′-bipyridyl (1.22 g, 7.8 mmol) in 150 mL DMF. The mixture was stirred at 80 °C for 1 hour to form the catalyst system. Then the solution of 2,7-dibromopyrene (500 mg, 1.4 mmol) in 40 mL DMF was added to the above solution and the resulting mixture was stirred at 80 °C for another 24 hours. After cooling to room temperature, to the mixture concentrated HCl (50 mL) was added. The precipitate was collected by filtration and washed by methanol and water. LPy-1 was dried in vacuum oven at 90 °C and obtained with a yield of 72.7 %.

*Synthesis of LPy-2:* Under the protection of N₂, 1,5-cyclooctadiene (1.01 mL, 8 mmol) was added
into the solution of bis(1,5-cyclooctadiene)nickel (2.15 g, 7.8 mmol) and 2,2'-bipyridyl (1.22 g, 7.8 mmol) in 80 mL DMF. The mixture was stirred at 80 °C for 1 hour to form the catalyst system. Then the solution of 1,6-dibromopyrene (500 mg, 1.4 mmol) in 40 mL DMF was added to the above solution and the resulting mixture was stirred at 80 °C for another 24 hours. After cooling to room temperature, to the mixture concentrated HCl (50 mL) was added. The precipitate was collected by filtrating and washed by methanol and water. LPy-2 was dried in vacuum oven at 90 °C and obtained with a yield of 61.4 %.

![LPy-2](image)

**Synthesis of CLPy:** Under the protection of N₂, 1,5-cyclooctadiene (1.01 mL, 8 mmol) was added into the solution of bis(1,5-cyclooctadiene)nickel (2.15 g, 7.8 mmol) and 2,2'-bipyridyl (1.22 g, 7.8 mmol) in 150 mL DMF. The mixture was stirred at 80 °C for 1 hour to form the catalyst system. Then 1,3,6,8-tetrabromopyrene (771 mg, 1.5 mmol) was added to the above solution and the resulting mixture was stirred at 80 °C for another 24 hours. After cooling to room temperature, to the mixture concentrated HCl (50 mL) was added. The precipitate was collected by filtrating and washed by methanol, water, acetone, and dichloromethane. CLPy was dried in vacuum oven at 90 °C and obtained with a yield of 76.1 %.

![CLPy](image)

**Synthesis of CL12Py:** The chemicals of tetrakis(triphenylphosphine)palladium (0) (15 mg, 0.01 mmol), K₂CO₃ (1.1 g, 8.0 mmol), 2,7-dibromopyrene (720 mg, 2 mmol), and 1,3,6,8-
tetrakis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyrene (706 mg, 1 mmol), were added into a 100 mL round bottom flask. The solvents of DMF (20 mL) and water (4 mL) were injected into the above flask in order. The reaction mixture was stirred at 150 °C for 48 h. After cooling down to temperature, the resulting precipitate was collected by filtration and thoroughly washed with methanol, H₂O, acetone and CH₂Cl₂. The product was collected and dried in vacuum at 90 °C for 24 h (yield, 75.5%).

**Synthesis of CL16Py:** The chemicals of tetrakis(triphenylphosphine)palladium (0) (15 mg, 0.01 mmol), 1,3,6,8-tetrakis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)pyrene (706 mg, 1 mmol), K₂CO₃ (1.1 g, 8.0 mmol), and 1,6-dibromopyrene (720 mg, 2 mmol) were added into a 100 mL round bottom flask. The solvents of DMF (10 mL) and water (4 mL) were injected into the above flask in order. The reaction mixture was stirred at 150 °C for 72 h. After cooling down to temperature, the resulting precipitate was collected by filtration and thoroughly washed with methanol, H₂O, acetone and CH₂Cl₂. The product was collected and dried in vacuum at 90 °C for 24 h (yield, 61.4%).

**Materials characterization and method:** Solid-state $^1$H-$^{13}$C CP/MAS NMR measurements were conducted on a JEOL RESONNCE ECZ 400R NMR spectrometer at a MAS rate of 12 kHz. FTIR spectra were carried out on a NICOLET 5397 AVATAR 360 FTIR. PXRD was recorded on a DX-2700B diffractometer with Cu Kα radiation. Thermogravimetric analysis (TGA) measurement was performed by using a differential thermal analysis instrument (Q1000DSC + LNCS + FACS Q600SDT) over the temperature range from 25 to 800 °C under a nitrogen atmosphere with a heating rate of 10 °Cmin$^{-1}$. The elemental analysis measurement was achieved on a EURO EA30000 Elemental Analyzer. The morphology and element analysis of polypyrenes were collected on an environmental scanning electron microscopy with an energy dispersive spectrometer (FEI QUANTA 600F). The specific surface area and pore size distributions was evaluated by N$_2$ adsorption at 77 K on an ASAP 2420-4 (Micromeritics) volumetric adsorption analyzer. Surface area was calculated in the relative pressure (P/P$_0$) ranging from 0.05 to 0.20. Sample was degassed at 120 °C for 12 h under vacuum (10$^{-5}$ bar) before analysis. Electron paramagnetic resonance measurement was conducted on the E500 (Bruker) to monitor the strength of pyrene radicals at different states. The DFT simulation on the electronic structure of polypyrenes was conducted by using Gaussian 09 at the B3LYP/6-31g(d) level. Density functional theory calculations for the binding energy are performed with the projector augmented wave (PAW) method. The exchange-functional is treated using the generalized gradient approximation (GGA) of Perdew-Burke-Ernzerhof (PBE) functional. The Integration accuracy is set as fine, SCF tolerance is fine, and the basis set is DNP+ in Dmol3 code. The equilibrium structure has been optimized with high precision. In addition, Spin polarizations was considered in all calculations. Finally, adsorbed energies of molecule were calculated as by: $E_b=E(1+nA)-E_1-nE(A)$. Where $E(1+nA)$ is the energy of polymer with anion A (Cl and [ZnCl$_4$]), the $E_1$ is the energy of polymer and $E(A)$ is the energy of A, n is the number of A.

*The electrochemical measurements of Polypyrene||Zinc batteries:* The working electrode was
prepared by mixing polypyrene, ketjen black, and polyvinylidene fluoride (PVDF) (5: 3 :2 by mass) in N-methylpyrrolidinone (NMP) and the resulting slurry was coated on a carbon-fiber paper current collector before drying at 80 °C for 12 h in a vacuum oven. The active mass loading is around 1.5 mg cm$^{-2}$. The cyclic voltammetry measurement was conducted in three-electrode cells using the polymers as cathodes, Zn metal as both the reference and counter electrodes, and ZnCl$_2$ aqueous solution as the electrolyte. The galvanostatic charge/discharge performance of polypyrene was evaluated in two-electrode cells by using polypyrene as working electrode, Zn foil as both the reference and counter electrodes, and glass fiber membrane as the separator in ZnCl$_2$ electrolyte with different concentrations. The cyclic voltammetry curves were run on a Gamry Interface 1010E workstation. The galvanostatic charge/discharge measurements were studied on an LANHE CT2001A battery tester.
**Fig. S1** The EDX spectra of (a) LPy-1, (b) LPy-2 and (c) CLPy.
**Fig. S2** The TGA curves of LPy-1, LPy-2 and CLPy under a N$_2$ atmosphere.

**Fig. S3** The SEM images of (a) LPy-1, (b) LPy-2 and (c) CLPy.

**Fig. S4** The (a) GCD curves and (b) cycling performance of conductive additive Ketjen black at room temperature.
Fig. S5 The GCD profiles of (a) CLPy and (b) Ketjen black at 50 °C. The specific capacities of CLPy cathode and Ketjen black are 204 and 37 mAh g⁻¹, respectively. Therefore, the CLPy delivers a higher specific capacity of 182 mAh g⁻¹ after subtracting the capacity (22.2 mAh g⁻¹) from conductive carbon additive at 50 °C. In addition, the high temperature also decreased the Coulombic efficiency of the battery due to the increased side reactions in the battery at a higher temperature.

**Fig. S7** Cyclic voltammogram curves for the polypyrenes at 0.1 V s⁻¹. (a) LPy-1. (b) LPy-2. (c) CLPy.

**Fig. S8** The structure characterization of CL12Py and CL16Py. (a) FT-IR spectra. (b) solid state $^{13}$C NMR. The SEM images of (c) CL12Py and (d) CL16Py.
**Fig. S9** The properties of CL12Py and CL16Py. (a) UV/Vis absorbance spectra. (b) N\textsubscript{2} adsorption-desorption curves. (c) Pore size distribution curves.

**Fig. S10** The cycling performance of CL12Py and CL16Py. The specific capacity of CL16Py increased with cycling, indicating an activated process due to the continuous infiltration of the electrolyte into CL16Py, which should be attributed to its low surface area (**Fig. S9**). The highly crosslinked structure with high surface area up to 940 m\textsuperscript{2} g\textsuperscript{-1} enables CL12Py to show very stable cycling performance.
Fig. S11 The polymer structures, properties and the specific capacities for the pyrene unit and the five synthesized polypyrenes. (a) The structure with numbered carbon (top) and the HOMO diagram (bottom) for the pyrene unit. (b) The polymer structures. (c) The surface areas. (d) The band gaps. (e) The specific capacities. (f) The HOMO distribution.
