\textsuperscript{a} Reaction conditions: 2 $\mu$M hexachloroethane, 8 mM Na\textsubscript{2}S, pH 7.50, and room temperature.

\textsuperscript{b} Fitted by pseudo-first-order model.
**Fig. S1** Deconvolution of C1s peak in X-ray photoelectron spectroscopy (XPS) spectra of P-char. The peaks with the binding energies of 284.3 eV, 286.5 eV, and 287.5 eV are assigned to the carbon atoms in aromatic rings (C-C/C=C), epoxy/ether (C-O-C), and carbonyl (C=O), respectively.
**Fig. S2** Mass balance for hexachloroethane reduction mediated by different carbonaceous materials, plotted as concentration changes of hexachloroethane and tetrachloroethane (product) with time. Error bars represent standard deviations calculated from triplicate samples. (a) P-char. (b) MCNT. (c) Graphite. Reaction conditions: 2 μM nitrobenzene, 8 mM Na₂S, pH 7.50, and room temperature.
**Fig. S3** Mass balance for hexachloroethane (initially at 2 μM) reduction by supernatant collected with filtration of suspension of P-char pre-reacted with Na₂S (8 mM) at pH 7.5 for 72 h, plotted as concentration changes of hexachloroethane and tetrachloroethane (product) with time. Error bars represent standard deviations calculated from triplicate samples.
**Fig. S4** UV-vis spectra of synthetic polysulfide prepared by mixing $S^0$ and Na$_2$S (totally in 8 mM) at 1:1 ratio in aqueous solution.
**Fig. S5** EPR spectra of synthetic polysulfide prepared by mixing $\text{S}^0$ and Na$_2$S (totally in 8 mM) at 1:1 ratio in DMF, along with the spectra of Na$_2$S only (0:1 ratio).
