Table S2: Aqueous reactions considered for surface complexation modeling<sup>1</sup>

Reaction	log K°
$\text{H}_2\text{O} = \text{H}^+ + \text{OH}^-$	-14.00
$\text{UO}_2^{2+} + \text{H}_2\text{O} = \text{UO}_2\text{OH}^+ + \text{H}^+$	-5.25
$\text{UO}_2^{2+} + 2\text{H}_2\text{O} = \text{UO}_2(\text{OH})_2 + 2\text{H}^+$	-12.15
$\text{UO}_2^{2+} + 3\text{H}_2\text{O} = \text{UO}_2(\text{OH})_3^- + 3\text{H}^+$	-20.25
$\text{UO}_2^{2+} + 4\text{H}_2\text{O} = \text{UO}_2(\text{OH})_4^{2-} + 4\text{H}^+$	-32.40
$2\text{UO}_2^{2+} + \text{H}_2\text{O} = (\text{UO}_2)_2(\text{OH})^{3+} + \text{H}^+$	-2.70
$2\text{UO}_2^{2+} + 2\text{H}_2\text{O} = (\text{UO}_2)_2(\text{OH})_2^{2+} + 2\text{H}^+$	-5.62
$3\text{UO}_2^{2+} + 4\text{H}_2\text{O} = (\text{UO}_2)_3(\text{OH})_4^{2+} + 4\text{H}^+$	-11.90
$3\text{UO}_2^{2+} + 5\text{H}_2\text{O} = (\text{UO}_2)_3(\text{OH})_5^{2+} + 5\text{H}^+$	-15.55
$3\text{UO}_2^{2+} + 7\text{H}_2\text{O} = (\text{UO}_2)_3(\text{OH})_7^- + 7\text{H}^+$	-32.20
$4\text{UO}_2^{2+} + 7\text{H}_2\text{O} = (\text{UO}_2)_4(\text{OH})_7^+ + 7\text{H}^+$	-21.90
$\text{UO}_2^{2+} + \text{CO}_3^{2-} = \text{UO}_2\text{CO}_3(\text{aq})$	9.94
$\text{UO}_2^{2+} + 2\text{CO}_3^{2-} = \text{UO}_2(\text{CO}_3)_2^{2-}$	16.61
$\text{UO}_2^{2+} + 3\text{CO}_3^{2-} = \text{UO}_2(\text{CO}_3)_3^{4-}$	21.84
$3\text{UO}_2^{2+} + 6\text{CO}_3^{2-} = (\text{UO}_2)_3(\text{CO}_3)_6^{6-}$	54.00
$2\text{UO}_2^{2+} + 3\text{H}_2\text{O} + \text{CO}_3^{2-} = (\text{UO}_2)_2\text{CO}_3(\text{OH})_3^- + 3\text{H}^+$	-0.86
$3\text{UO}_2^{2+} + 3\text{H}_2\text{O} + \text{CO}_3^{2-} = (\text{UO}_2)_3\text{CO}_3(\text{OH})_3^+ + 3\text{H}^+$	0.65

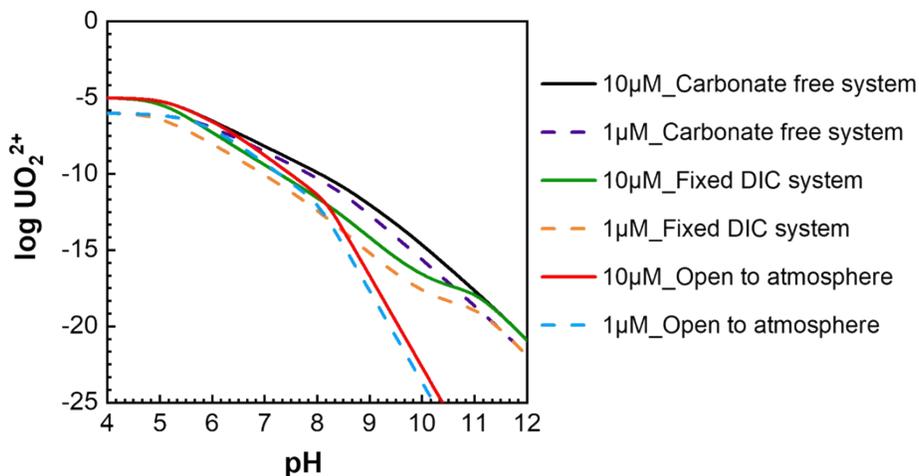

Figure S1: Variation of  $\log \text{UO}_2^{2+}$  as a function of pH. The ionic strength is fixed at 0.01 M.

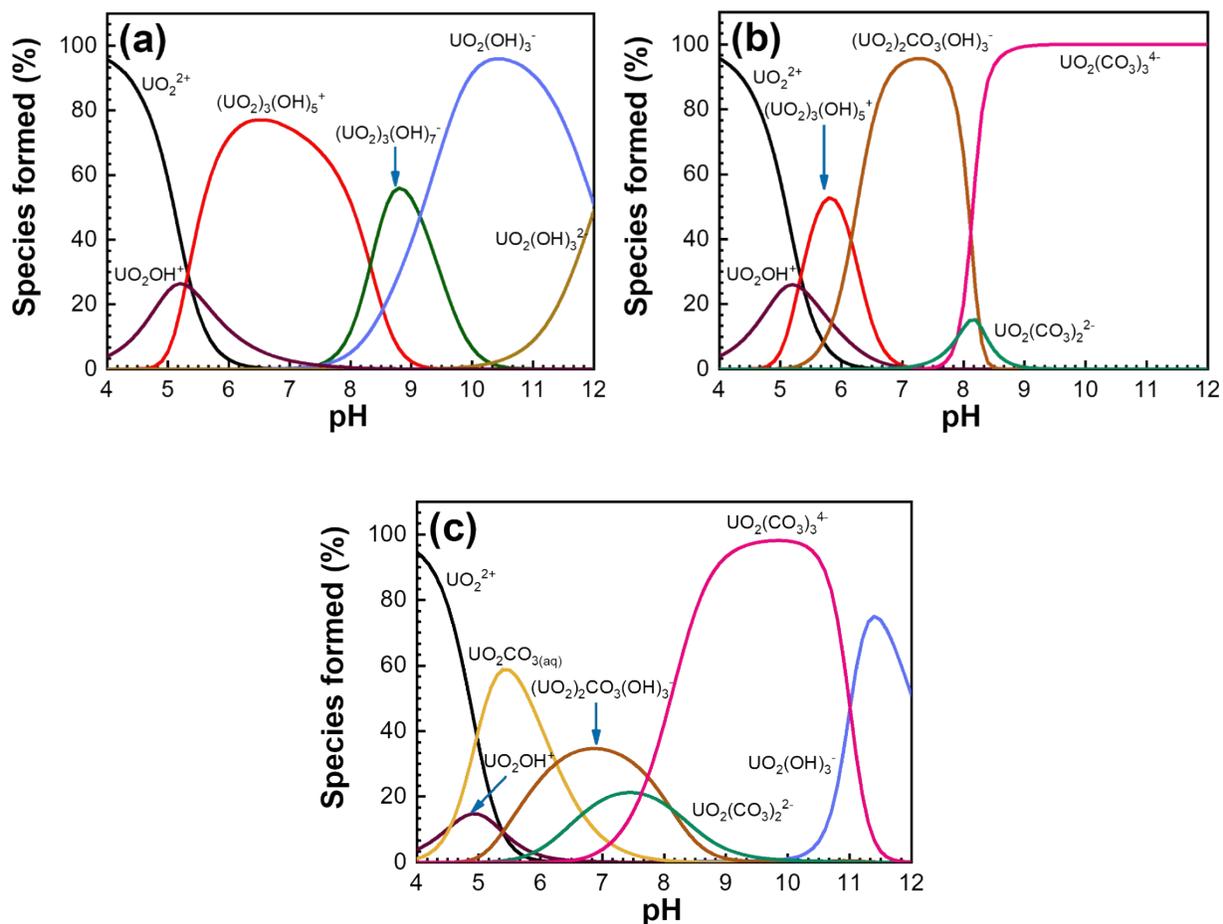

Figure S2: Speciation of U(VI) in (a) carbonate-free system, (b) open to atmosphere system, and (c) fixed dissolved inorganic carbon (DIC) system. U(VI) loading for all carbonate conditions is 10  $\mu\text{M}$  and ionic strength is 0.01 M.

### Calculation for estimating number of rhamnolipids attached per nanoparticle

Before ultracentrifuge (Rhamnolipid excess + Rhamnolipid attached to IONPs + Oleic acid attached to IONPs) = 84.48 mg/L as C

After ultracentrifuge, Rhamnolipid excess = 11.16 mg/L as C

Total carbon attached to IONPs = 73.32 mg/L as C

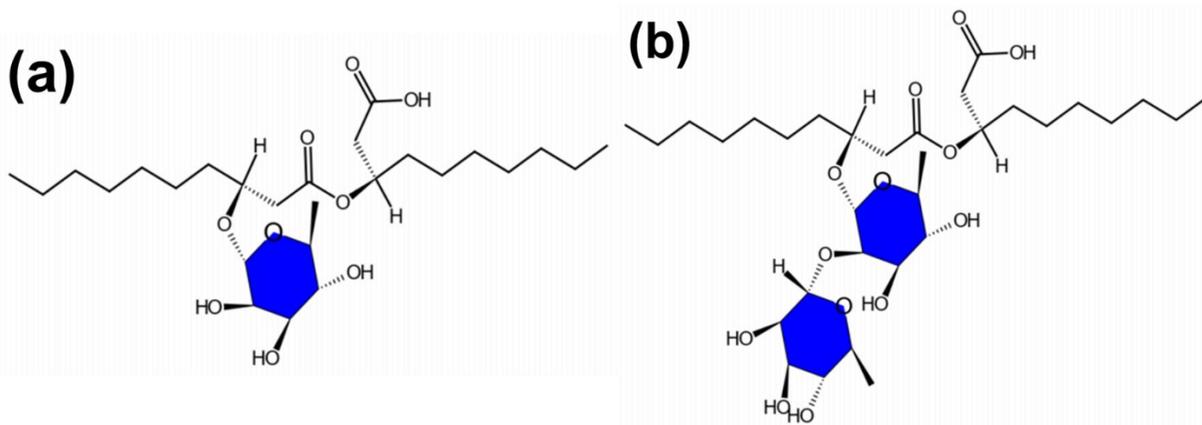

Figure S3: Structures of (a) Monorhamnolipid and (b) Dirhamnolipid

As rhamnolipids have two hydrophobic chains so it is assumed that one molecule of rhamnolipid gets attached to two nanoparticles. This will be considered as one entity in further calculations.

The total number of carbon atoms in one entity = 65.6 carbon atoms (as the standard obtained is a mixture of monorhamnolipid (40%) and dirhamnolipid (60%))

Density of IONPs as magnetite = 5 g/cm<sup>3</sup>

The total volume of particles in V liter of suspension = 6.16\*10<sup>-2</sup> V cm<sup>3</sup>

Assuming the diameter of 9 nm,

Number of IONPs in suspension = 1.51 \* 10<sup>17</sup> V

Concentration of entities in the suspension = 73.32 / (65.6\*12\*1000) = 9.31 \* 10<sup>-5</sup> M

Moles of entities in suspension of Volume V = 9.31 \* 10<sup>-5</sup> mol/ liter\* V (liters) = 9.31 \* 10<sup>-5</sup> \* V moles

1 mole contains 6.022 \* 10<sup>23</sup> entities, hence total number of entities in suspension = 56.06 x 10<sup>18</sup> V

Number of entities attached per nanoparticle = 371.2 entities per nanoparticle or 185.6 rhamnolipids per nanoparticle (as 1 rhamnolipid molecule gets attached to two oleic acid molecules)

Site density estimated per surface area of magnetite nanoparticle = 0.73 sites/nm<sup>2</sup>

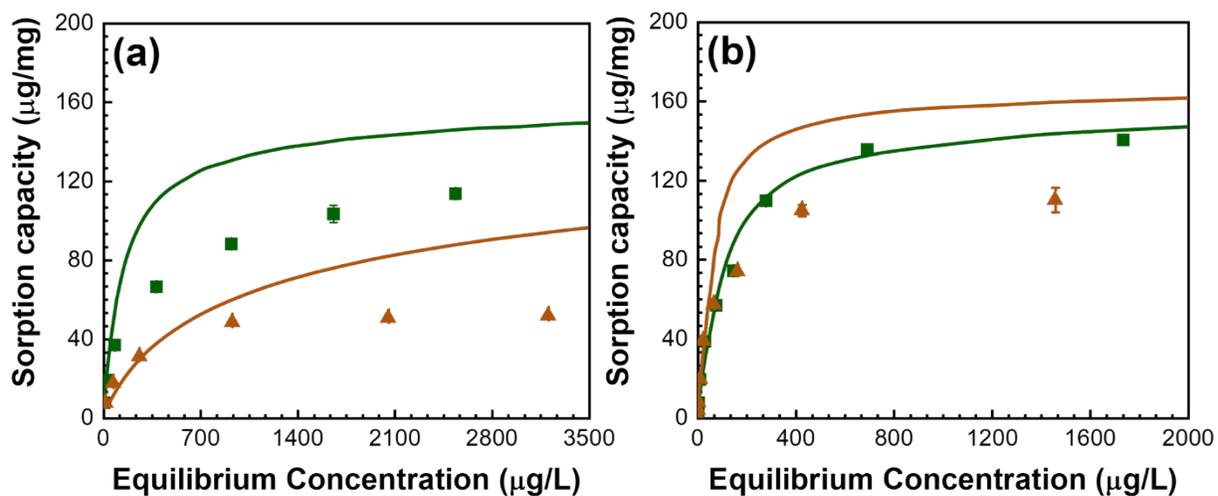

Figure S4: Fitting SCM obtained parameters to isotherm obtained for NEM model in (a) Open to atmosphere system and (b) Carbonate-free system. ▲ represent points obtained at pH =8 and ■ represent points obtained at pH=6. Solid lines are the fitting lines obtained using NEM at pH 6 and pH 8.

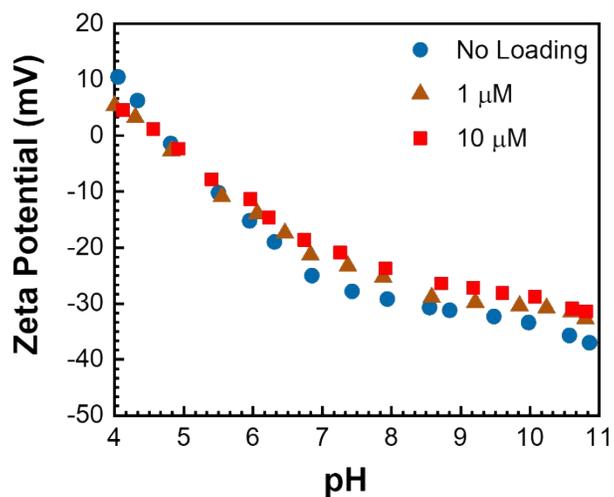

Figure S5: Effect of uranium loading on zeta potential of rhamnolipid-coated nanoparticles
