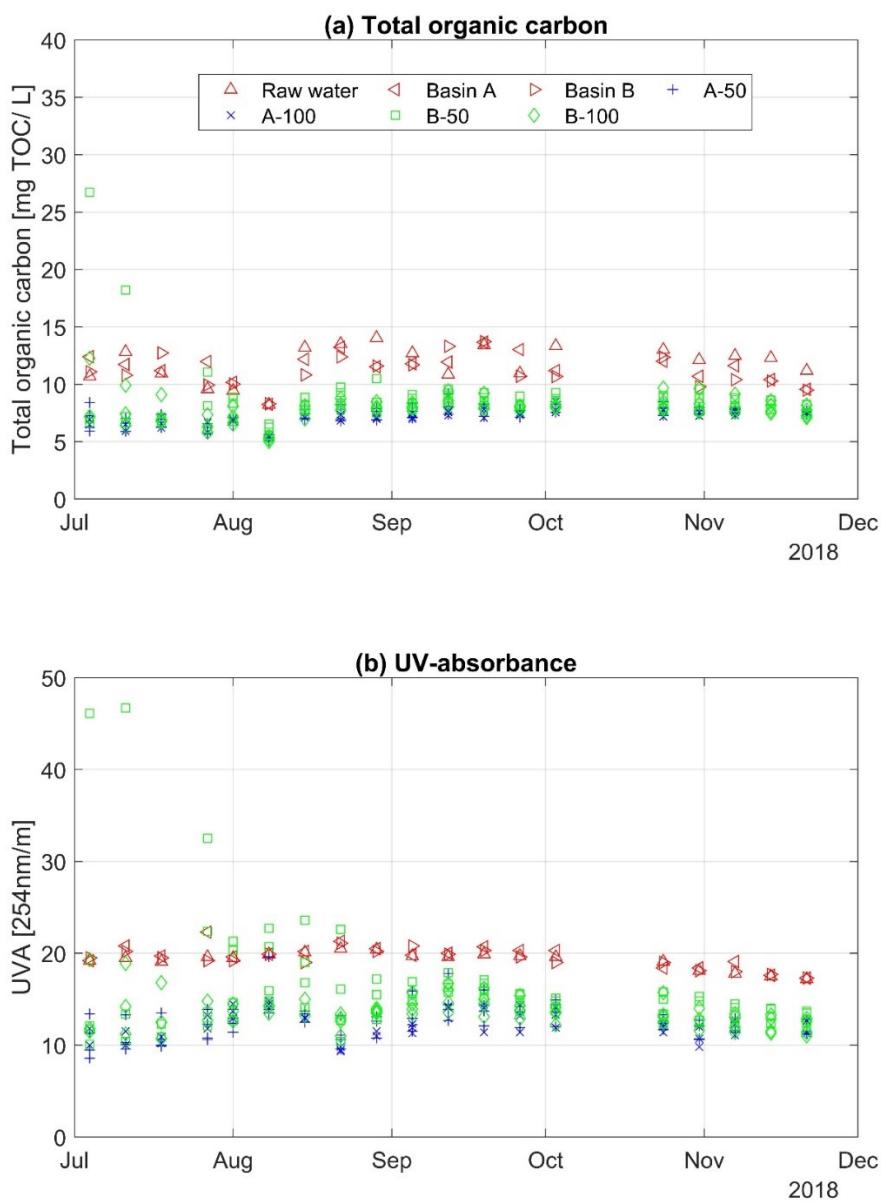

Fig. A2 Natural organic matter variability during artificial recharge. The figure shows (a) TOC and (b) UVA from raw water, Basin A and B, and all individual soil water samplers

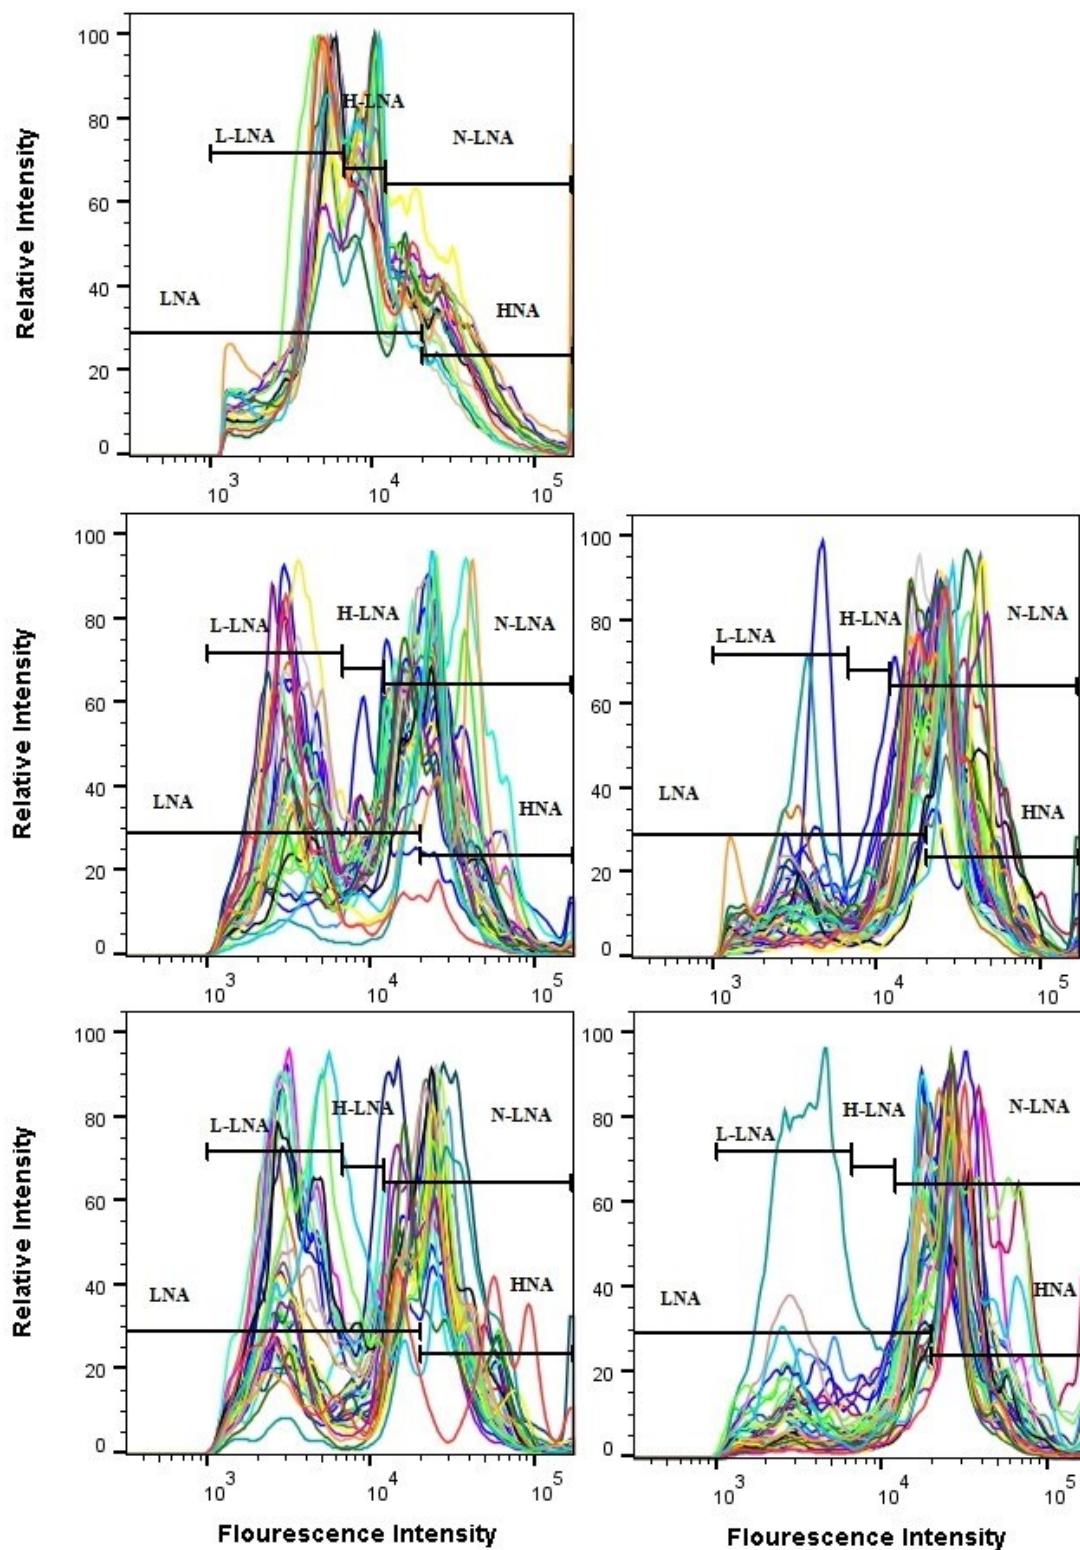

Fig. A3 Fingerprints of all the collected fingerprints for the raw water (top left), A-50 (center left), A-100 (bottom left), B-50 (center right) and B-100 (bottom right). Each line represents one of the triplicates from each water sample. The figure shows a clear difference between samples taken from Basin A and B. Percent HNA was significantly higher in samplers under Basin B whereas the HNA peaks for both sides are similar to one another compared to the LNA peaks. The LNA peaks on the A-side are not present on the B-side, with three exceptions.

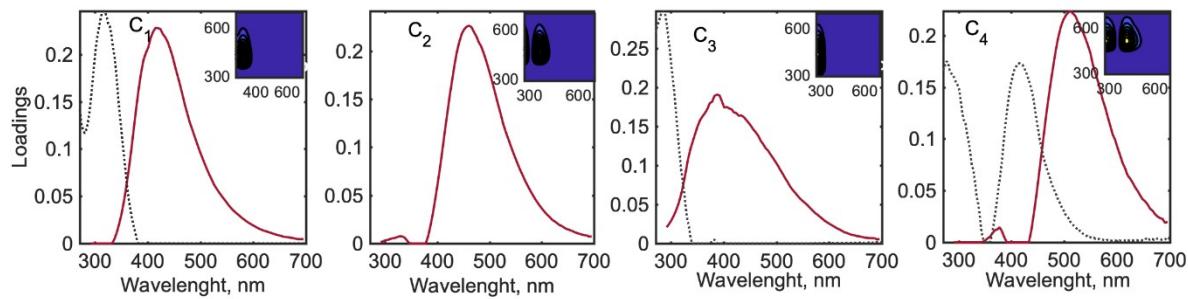

Fig. A4 Spectral properties of the PARAFAC components.

Table A1 All results from t-test conducted on the TOC and UVA measurements by comparing two pairs of locations (L_1 and L_2). Location “All samplers” refers to all soil water samples. A-50, B-50, A-100 and B-100 refers to all samplers at 50 and 100 cm under Basin A and B, respectively. The table shows the samplings location, the parameter, the mean value, the variance, p-value from one and two tailed test.
