*Insights into air pollution chemistry and sulphate formation from nitrous acid (HONO) measurements during haze events in Beijing* 

## SUPPLEMENTARY INFORMATION

## **Supplementary Figures**

**Figure S1**: Observationally-derived  $P_{sulphate}$  values via E2, discounting advection impacts – see text for details.

Figure S2: Observed (red points) and NAQPMS modelled (black line) OH concentrations

**Figure S3**: Correlation between PSS-calculated and observed HONO mixing ratios, coloured by SO<sub>4</sub> abundance

**Figure S4**: Model predicted sulphate formation rates (Ionic strength = zero case) for the  $H_2O_2$ ,  $O_3$ ,  $NO_2$  and TMI mechanisms – axis expansion from Figure 6.

## Supplementary Tables:

ST1, ST2 : 24-hour mean observed meteorological parameters, key gas phase mixing rations and aerosol (condensed phase) concentrations

ST3, ST4: Condensed-phase model kinetic parameters adopted

| Date       | Met. Pai | rameters  | Measured mixing ratios / ppb |      |                 |                 |                 |
