Supplementary Figure S1. The thirty formulations tested for this project. 2-thiol to 4-thiol and 2-ene to Hitenol KH functional group molar ratios were altered to test the effect of crosslinking and surfactant concentration.

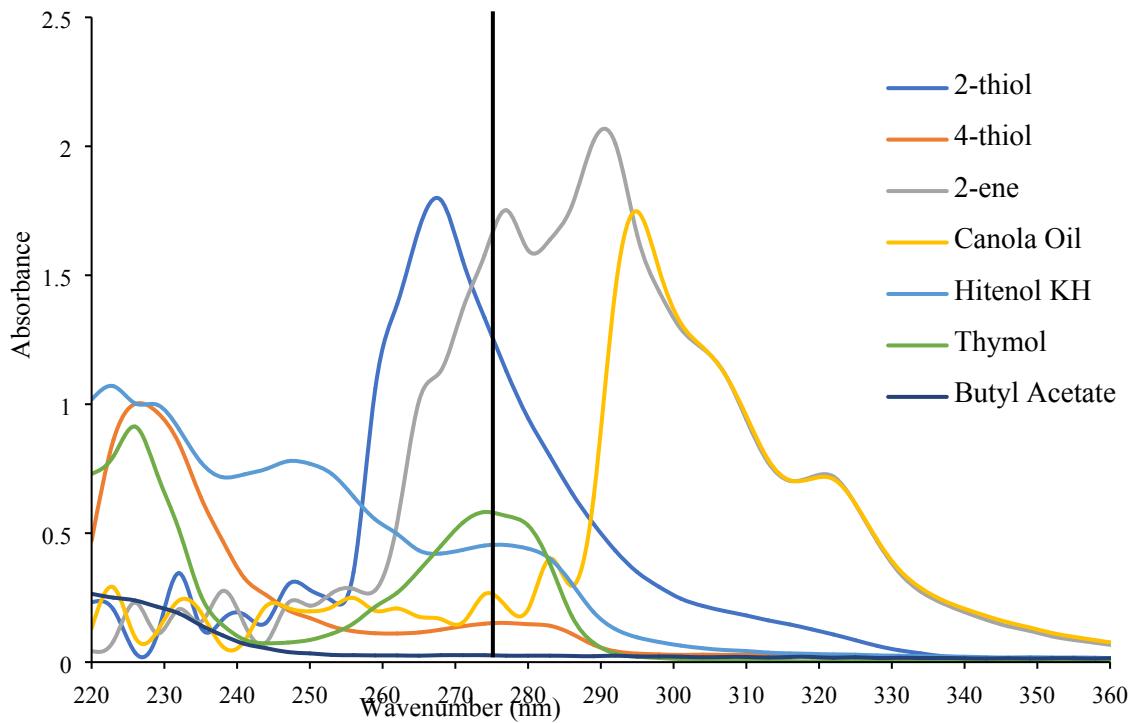

Supplementary Figure S2. The UV-Vis spectrum of PBS after three centrifugation cycles, soaking in DI water for 24 hours, and one final centrifugation cycle.

Supplementary Figure S3. Nanodrop peak-height measurements at 275 nm. Nanodrop peak-height measurements at 275 nm demonstrating the decreasing amounts of unreacted reagents with an increase in centrifugation cycles. (a) first purification method that used 7 centrifuge cycles to achieve greater than 99 % purity; (b) second purification method that used three centrifuges, a 24-hour soak in DI water, and one final centrifuge cycle.

Supplementary Figure S4. UV-Vis measurements showing butyl acetate (a) Peak height at 275 nm for UV-Vis demonstrating the low absorbance values for the butyl acetate control particles that have no statistical change from day 1 to day 5 ($p \leq 0.05$). (b) The UV spectrum is identical to that of butyl acetate.

Supplementary Figure S5. UV-Vis of all monomers. Nanodrop UV-Vis spectra of all monomers, surfactant, and solvents used. The UV spectra for all components overlap at 275 nm.
