## 1. Experimental protocols

### 1.1 General methods

X-6 melting point apparatus was used to measure the melting points. Precoated silica gel plates were used to perform TLC analysis. Bruker AV 600 spectrometer was used to record NMR spectra by treating tetramethylsilane (TMS) as an internal standard. IonSpec FT-ICR mass spectrometer with ESI resource is used to record the high-resolution mass spectra (HRMS). All fluorescence spectra were recorded on F-7000 Spectrofluorimeter (Hitachi, Tokyo, Japan) equipped with 1.0 cm quartz cells, the widths of both the excitation and emission slit were set as 2.5 nm , and the excitation wavelength was 280 nm . Fluorescence spectra were recorded at 290 K in the range of $300-550 \mathrm{~nm}$. The UV spectrums were recorded at room temperature on a TU-2450 spectrophotometer (Puxi Analytic Instrument Ltd. of Beijing, China) equipped with 1.0 cm quartz cells. Tris and HCl were analytical purity. Sample masses were weighed on a microbalance with a resolution of 0.1 mg . All other chemicals and solvents were commercially available, and were used without further purification.

The stock solution of compound $\mathbf{4 b}$ was prepared in DMSO. Calf thymus DNA (Sigma Chemical Co., St. Louis, MO) was used without further purification, and its stock solution was prepared by dissolving an appropriate amount of DNA in doubly distilled water. The solution was allowed to stand overnight and stored at $4{ }^{\circ} \mathrm{C}$ in the dark for about one week. The concentration of DNA in stock solution was determined by UV absorption at 260 nm using a molar absorption coefficient $\xi_{260}=6600 \mathrm{~L} \cdot \mathrm{~mol}^{-1} \cdot \mathrm{~cm}^{-1}$ (expressed as molarity of phosphate groups) by Bouguer-Lambert-Beer law. The purity of DNA was checked by monitoring the ratio of the absorbance at 260 nm to that at 280 nm . The solution gave a ratio of $>1.8$ at A260/A280, which indicated that DNA was sufficiently free from protein. NR stock solution was prepared by dissolving its solid (Sigma Chemical Co.) in doubly distilled water and was kept in a cool and dark place. All the solutions were adjusted with Tris- HCl buffer solution ( $\mathrm{pH}=7.4$ ), which was prepared by mixing and diluting Tris solution with HCl solution. All chemicals were of analytical reagent grade, and doubly distilled water was used throughout.

### 1.2. Antibacterial and antifungal assays

In comparison with the bacteria, the tested fungi were less sensitive to target aloe-emodin azoles 3-8. The target aloe-emodins gave no obvious suppression on C. albicans strains, and displayed low activity towards C. parapsilosis ATCC 22019, except for 2-mercaptotriazole derivative $\mathbf{7 b}(\mathrm{MIC}=16 \mu \mathrm{~g} / \mathrm{mL})$. In addition, as for $C$. tropicalis, aloe-emodins $\mathbf{4 a}$,

4b and $\mathbf{8}$ exhibited moderate potency, which might be attributed to the existence of 1,2,4-triazole, non-substituted tetrazole, indole and 2-mercaptobenzimidazole, respectively. Remarkably, all the aloe-emodin azoles showed better activities against A. fumigatus ( $\mathrm{MIC}=4-64 \mu \mathrm{~g} / \mathrm{mL}$ ) than clinical antifungal fluconazole ( $\mathrm{MIC}=256 \mu \mathrm{~g} / \mathrm{mL}$ ), except for 2-mercapto-1-methylimidazole 7a. It is worth noting that benzotriazolyl aloe-emodin $\mathbf{5 e}$ and 2-mercaptotriazole derivative 7b possessed prominent suppression on A. fumigatus strains with MIC value as low as $4 \mu \mathrm{~g} / \mathrm{mL}$. Therefore, the two compounds are promising to serve as anti-A. fumigatus agents to be further exploited.

Table S1. Antifungal data as MIC $\left(\mu \mathrm{g} \cdot \mathrm{mL}^{-1}\right)$ for compounds 3-8.

${ }^{a}$ C. a., Candida albicans; C. t., Candida tropicalis; A. f., Aspergillus fumigatus; C. p. 22019, Candida parapsilosis ATCC 22019.
The prepared compounds were evaluated for their antibacterial activities against Gram-positive bacteria (MRSA, Enterococcus faecalis, Staphylococcus aureus, Staphylococcus aureus ATCC 25923, and Staphylococcus aureus ATCC 29213) and Gram-negative bacteria (Klebsiella pneumoniae, Escherichia coli, Escherichia coli ATCC 25922, Pseudomonas aeruginosa, Pseudomonas aeruginosa ATCC 27853, and Acinetobacter baumannii) with the positive control of clinical antibacterial drug norfloxacin. The bacterial suspension was adjusted with sterile saline to a concentration of $1 \times 10^{5} \mathrm{CFU}$. Initially the compounds were dissolved in DMSO to prepare the stock solutions, then the tested compounds and reference drugs were prepared in Mueller-Hinton broth (Guangdong huaikai microbial sci. \& tech co., Ltd, Guangzhou, Guangdong, China) to obtain the required concentrations of $512,256,128,64,32,16,8,4,2,1,0.5 \mu \mathrm{~g} \cdot \mathrm{~mL}^{-1}$. These dilutions were inoculated and incubated at $37^{\circ} \mathrm{C}$ for 24 h . Antibacterial screening demonstrated that some of the target compounds could effectively inhibit the growth of the tested bacteria and exhibit broad antimicrobial spectrum.

Likewise, all the prepared hybrids were tested for their antifungal properties against four fungi (Candida albicans, Candida tropicalis, Aspergillus fumigatus, and Candida parapsilosis ATCC 22019) with respect to clinical fluconazole. A spore suspension in sterile distilled water was prepared from one day old culture of the fungi growing on Sabouraud agar (SA) media. The final spore concentration was observed to be $1-5 \times 10^{3}$ spore $\cdot \mathrm{mL}^{-1}$. Eleven required concentrations

Minimal inhibitory concentration (MIC, $\mu \mathrm{g} \cdot \mathrm{mL}^{-1}$ ) is defined as the lowest concentration of the new compounds that completely inhibit the growth of fungi, by means of standard two-fold serial dilution method in 96-well microtest plates $\left(0.5-512 \mu \mathrm{~g} \cdot \mathrm{~mL}^{-1}\right)$ of each tested compound were prepared by making dilutions in sterile RPMI 1640 medium using compound's stock solutions. These dilutions were inoculated and incubated at $35{ }^{\circ} \mathrm{C}$ for 24 h according to the Clinical \& Laboratory Standards Institute (CLSI). The tested microorganism strains were provided by the Clinical Laboratory Department, Sichuan Academy of Medical Sciences \& Sichuan Provincial People's Hospital. To ensure that the solvent had no effect on antifungal growth, a control test was performed with test medium supplemented with DMSO at the same dilutions as used in the experiment. All the fungi growth was monitored visually and spectrophotometrically. The lowest concentration (highest dilution) required to arrest the growth of fungi was regarded as minimal inhibitory concentration (MIC).

### 1.3. Resistance development assay

The representative compound $\mathbf{4 b}$ was selected to investigate the developing rate of bacterial resistance according to the reported method. We exposed a standard strain of resistant MRSA toward increasing concentrations of compound $\mathbf{4 b}$ from sub-MIC ( $0.5 \times$ MIC, MIC is the minimal inhibitory concentration) for sustained passages and determined the new MIC values of compound $\mathbf{4 b}$ for each passage of MRSA. The initial MIC values of compound $\mathbf{4 b}$ and norfloxacin were determined against MRSA as mentioned above in antibacterial assay. For the next MIC experiment, the bacterial dilution was prepared by using the bacteria from sub-MIC concentration of the compound ( $0.5 \times \mathrm{MIC}$ ). After a 12 h incubation period, again bacterial dilution was prepared by using the bacterial suspension from sub-MIC concentration of the compound $(0.5 \times \mathrm{MIC})$ and assayed for the next MIC experiment. The process was repeated for 15 passages. The MIC values for compound $\mathbf{4 b}$ and norfloxacin against each passage of MRSA were determined.

### 1.4. Cytotoxicity

Cell viability upon the treatment of the prepared compounds were tested by using the CCK8 assay. Briefly, a suspension of cells (3000/well for normal human liver cell line LO2) were seeded in 96 -well plates and cultured for 24 h . Then different concentrations ranging from 100 to $6.25 \mu \mathrm{M}$ (PBS buffer containing $1 \%$ DMSO) for the compound $\mathbf{4 b}$ were added into the 96 -well plates, in which cells were incubated for 72 h . Then, $10 \mu \mathrm{~L}$ of CCK8 solution was added to each well of the plates and incubated at $37^{\circ} \mathrm{C}$ for 2 h . The absorbance of each well was measured at 450 nm in a microplate reader. At last, resultant $\mathrm{OD}_{450 \mathrm{~nm}}$ values were expressed as $\mathrm{IC}_{50}$ values. The anti-tumor growth effects of compound $\mathbf{4 b}$ in vitro were studied via measuring the viability of Hep-G2 cell using the above approach. The relative inhibition rates of cancer cell growth and $\mathrm{IC}_{50}$ values were calculated and plotted by GraphPad Prism6. Experiments were repeated at least three times.

Figure S1. Cytotoxic assay of the active compound $\mathbf{4 b}$ on human hepatocyte LO 2 cell line, $\mathrm{IC}_{50}=26.62$, selectivity index $=11.76(\mathrm{left})$

$$
\text { and hepatoma Hep-G2 cell line, } \mathrm{IC}_{50}=11.76 \text {, selectivity index }=1.96 \text { (right). }
$$

### 1.5. ROS generation

Intracellular ROS was measured using standard 2,7-dichlorofluoroscein diacetate (DCFH-DA) assay. Then $10^{6} \mathrm{CFU} / \mathrm{mL}$ of MRSA strain cells were treated with increasing concentrations of compound $\mathbf{4 b}$ for 6 h at $37{ }^{\circ} \mathrm{C}$. Following treatment, both control and treated cells were washed with PBS and incubated with $10 \mu \mathrm{M}$ DCFH-DA probe for 30 min in dark at $37{ }^{\circ} \mathrm{C}$. The green fluorescence originating from the oxidative cleavage of DCFH-DA to DCF was measured with an excitation wavelength of 485 nm and emission wavelength of 528 nm . The fold increase in intracellular ROS production in cells treated with compound $\mathbf{4 b}$ in comparison to control cells was plotted.

Figure S2. Changes of ROS level in MRSA treated by compound $\mathbf{4 b}(12 \times \mathrm{MIC})$.

### 1.6. Bacterial membrane permeabilization

The overnight grown culture of MRSA was harvested ( $10000 \mathrm{rpm}, 1 \mathrm{~min}$ ), washed, and resuspended in 5 mM glucose and 5 mM HEPES buffer $(\mathrm{pH}=7.4)$ in $1: 1$ ratio. Then an amount of $10 \mu \mathrm{~L}$ of test compound $\mathbf{4 b}(12 \times$ MIC $)$ was added to a cuvette containing 2 mL of bacterial suspension and $10 \mu \mathrm{M}$ propidium iodide (PI). Fluorescence was monitored at excitation wavelength of 535 nm (slit width of 10 nm ) and emission wavelength of 617 nm (slit width of 5 nm ). A control experiment was performed by treating the preincubated bacterial and dye solution only with water ( $10 \mu \mathrm{~L}$ ).

### 1.7. Fluorescence microscopy

The overnight grown culture of MRSA was treated with compound $\mathbf{4 b}(12 \times$ MIC $)$, and $0.1 \%$ Triton X-100 was used as positive control. All the treated and untreated cells (as negative control) were washed once with $1 \times$ PBS (the images were captured with a $10 \times$ objective in electron microscope) and stained with 4.5 mM PI for 15 min at $37^{\circ} \mathrm{C}$ Finally, the images were captured with a $10 \times$ objective in fluorescence microscope using green light.

### 1.8. Interactions with calf thymus DNA

DNA is an informational molecule encoding the genetic information, which makes it one of the objectives for the studies of biologically important small molecules such as antimicrobial drugs. Recently, DNA is increasingly investigated for interaction with small molecules in the rational design and construction of novel and efficient drugs. To explore the possible antimicrobial action mechanism, calf thymus DNA was selected as DNA model because of its medical importance, low cost and ready availability properties to study the binding behavior of compound $\mathbf{4 b}$ with calf thymus DNA on molecular level using neutral red (NR) dye as a spectral probe in vitro by UV-vis spectroscopic methods.

### 1.8.1. Absorption spectra of DNA in the presence of compound 4b

In this study, UV-vis absorption spectra were documented while the concentration of DNA being fixed with the consecutive and proportional increase of the concentration of compound 4b. As demonstrated in Fig. S3, the UV-vis absorption of DNA was first observed at 260 nm which showed gradual increase in absorbance associated by a slight red shift with the raising concentration of compound $\mathbf{4 b}$. Moreover, the absorbance of $\mathbf{4 b}$-DNA complex (inset of Fig. S2) was recorded less than that of the sum of free DNA and free compound $\mathbf{4 b}$, which signified that a weak hypochromic effect has occurred between the CT-DNA and compound $\mathbf{4 b}$. Both the hypochromic effect and hypochromic region preliminarily disclosed that the interaction mode of compound $\mathbf{4 b}$ was the intercalation into DNA, which were in accordance with the displayed spectral changes.

On the base of variations in the absorption spectra of DNA upon binding to compound $\mathbf{4 b}$, equation (1) can be utilized to calculate the binding constant $(K)$.

$$
\begin{equation*}
\frac{A^{0}}{A-A^{0}}=\frac{\xi_{C}}{\xi_{D-C}-\xi_{C}}+\frac{\xi_{C}}{\xi_{D-C}-\xi_{C}} \times \frac{1}{K[Q]} \tag{1}
\end{equation*}
$$

$A^{0}$ refers to the absorbance of DNA in the absence of compound $\mathbf{4 b}$ while $A$ refers to the absorbance in the presence of $\mathbf{4 b}$ at 260 nm . In addition, $\xi_{C}$ and $\xi_{D-C}$ represents the absorption coefficients of compound $\mathbf{4 b}$ and compound $\mathbf{4 b} \mathbf{b N A}$ complex respectively. Also, $[Q]$ stands for the volumetric molar concentration of compound $\mathbf{4 b}$ measured as mol $\cdot \mathrm{L}^{-1}$ unit. The plot of $A^{0} /\left(A-A^{0}\right)$ vs $1 /[$ compound $\mathbf{4 b}$ ] is plotted by making use of the absorption titration data and linear fitting (Fig. S4), binding constant, $K=3.421 \times 10^{5} \mathrm{~L} \cdot \mathrm{~mol}^{-1},(\mathrm{R}=0.990, \mathrm{SD}=0.008)$. Here, R is the correlation coefficient while SD refers to standard deviation. ( R is the correlation coefficient, and SD is standard deviation).

Figure S3. UV absorption spectra of DNA with different concentrations of compound $\mathbf{4 b}(\mathrm{pH}=7.4, \mathrm{~T}=290 \mathrm{~K})$. Inset: comparison of absorption at 2

60 nm between the compound $\mathbf{4 b}-$ DNA complex and the sum values of free DNA and free compound $\mathbf{4 b}$. $c($ DNA $)=5.25$ $\times 10^{-5} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$, and $\mathrm{c}($ compound $\mathbf{4 b})=0-1.25 \times 10^{-5} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$ for curves $\mathbf{a}-\mathbf{g}$ respectively at increment $0.25 \times 10^{-5}$

Figure S4. The plot of $A^{0} /\left(A-A^{0}\right)$ versus $1 /[$ compound 4b]

### 1.8.2. Absorption spectra of NR interactions with DNA

To further understand the interaction between compound $\mathbf{4 b}$ and DNA, the absorption spectra of competitive interaction of compound $\mathbf{4 b}$ with Neutral Red (NR) were investigated. NR is a planar phenazine dye possessing a higher stability, lower toxicity and more convenient application, compared with other common probes. Furthermore, the binding of NR with DNA is an intercalative mode which has been sufficiently demonstrated. Therefore, NR was used as a spectral probe to investigate the binding mode of $\mathbf{4 b}$ with DNA in the present work. The absorption spectra of the NR dye upon the addition of DNA are depicted in Fig. S5. Apparently, the absorption peak of the NR at around 460 nm showed gradual decrease with the increasing concentration of DNA, and a new band at around 530 nm developed. This could be attributed to the formation of the new DNA-NR complex. An isosbestic point at 504 nm provided additional evidence of DNA-NR complex formation.

Figure S5. UV absorption spectra for NR and DNA $(\mathrm{pH}=7.4, \mathrm{~T}=298 \mathrm{~K}) . c(\mathrm{NR})=2 \times 10^{-5} \mathrm{~mol} \cdot \mathrm{~L}^{-1}$, and $c(\mathrm{DNA})=0-3.81 \times 10^{-5}$ $\mathrm{mol} \cdot \mathrm{L}^{-1}$ at an increment of $0.48 \times 10^{-5}$ for curves $a-i$ respectively.

### 1.9. Molecular docking

To further understand the mechanism of action of the synthesized compounds, highly active molecule $\mathbf{4 b}$ was docked
into the active site of MRSA DNA isomerase (PDB code: 2XCS). Sybyl 2.0 and Pymol 4.5 .0 was used to perform the docking work. The gird size was set to be $45 \times 45 \times 45$ and the grid point spacing was set at default value $0.375 \AA$. The Lamarkian genetic algorithm (LGA) was applied for the conformational search.

### 1.10. General procedure and spectral data for some prepared compounds

### 1.10.1. Synthesis of 3-(chloromethyl)-1,8-dihydroxyanthracene-9,10-dione (2)

Aloe emodin (1) ( $2.70 \mathrm{~g}, 10 \mathrm{mmol}$ ) was dissolved in 200 mL anhydrous $N, N$-dimethylformamide, and sulfoxide chloride $(20 \mathrm{~mL}, 275 \mathrm{mmol})$ was slowly dropped in an ice bath. After stirring for 1 h , the reaction was removed from the ice bath at room temperature. TLC was followed until the end of the reaction. The compound $\mathbf{2}$ was quenched with ice water, filtered, washed and recrystallized. Yield: $61.0 \%$, melting point: $138-140^{\circ} \mathrm{C}$.

### 1.10.2. Synthesis of 1,8-dihydroxy-3-((2-nitro-1H-imidazol-1-yl)methyl)anthracene-9,10-dione (3a)

A mixture of 2-nitroimidazole ( $84 \mathrm{mg}, 0.75 \mathrm{mmol}$ ) and potassium carbonate ( $138 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) were stirred in acetonitrile ( 10 mL ) at $65{ }^{\circ} \mathrm{C}$. Compound $2(144 \mathrm{mg}, 0.50 \mathrm{mmol})$ was added and reflux was performed at $80^{\circ} \mathrm{C}$. Thin-layer chromatography was followed until the end of the reaction. After cooling to room temperature and neutralizing with glacial acetic acid until pH was neutral, the filtrate was then extracted and purified by column chromatography (Eluent: petroleum ether/ethyl acetate (10/1-10/3, V/V)), the compound 3a ( 40 mg ) was obtained as yellow solid, yield: $22.4 \%$, melting point: $>250{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 11.97(\mathrm{~s}, 2 \mathrm{H}$, anthraquinone- $1,8-\mathrm{OH}), 8.46(\mathrm{~s}, 1 \mathrm{H}$, imidazole-4- $H$ ), $8.15(\mathrm{~s}, 1 \mathrm{H}$, imidazole-5- $H$ ), $7.86(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-H), 7.84 (s, 1H, anthraquinone-4-H), $7.83(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7-H), $7.78(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6- $H$ ), 7.44 (s, 1 H , anthraquinone-2-H), $5.75\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 191.98,181.67,161.93,147.84,146.20$, $138.15,137.96,134.40,133.73,125.03,123.50,122.13,119.89,118.78,116.36,50.55 ;$ HRMS (ESI) calcd. for $\mathrm{C}_{18} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}_{6}[\mathrm{M}+\mathrm{H}]^{+}: 366.0726$; found, 366.0725.

The preparation method of compound $\mathbf{3 b} \mathbf{- 8}$ is the same as that of compound 3a.

### 1.10.3. Synthesis of 1,8-dihydroxy-3-((4-nitro-1H-imidazol-1-yl)methyl)anthracene-9,10-dione (3b)

Yellow solid, yield: $60.4 \%$, melting point: $>250{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 11.90$ (s, 2H, anthraquinone-1,8-OH), $8.59(\mathrm{~s}, 1 \mathrm{H}$, imidazole-5-CH), $8.09(\mathrm{~s}, 1 \mathrm{H}$, imidazole-2-CH), $7.81(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{C} H)$, 7.71-7.68 (m, 2H, anthraquinone-4,5-2CH), $7.40(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7-CH), $7.38(\mathrm{~d}, J=10.0 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-2-CH), $5.46\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta$ 191.98, 181.67, 161.93, 147.84, 146.20, $138.15,137.96,134.40,133.74,125.01,123.49,122.13,119.89,118.78,116.36,50.52$; HRMS (ESI) calcd. for $\mathrm{C}_{18} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}_{6}$ $[\mathrm{M}+\mathrm{H}]^{+}: 366.0726$; found, 366.0725.

Yellow solid, yield: 31.1\%, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 11.95$ (s, 2H, anthraquinone-1,8-OH), $10.14(\mathrm{~s}, 1 \mathrm{H}$, imidazole-4- $H$ ), $8.15(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4- $H$ ), $7.87(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-H), $7.85(\mathrm{~d}, J=4.9 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7-H), $7.79(\mathrm{t}, J=7.1 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6-H), $7.44(\mathrm{~d}, J=$ 8.4 Hz, 1H, anthraquinone-2-H), $5.33\left(\mathrm{~d}, J=4.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2}\right), 5.23\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH} \mathrm{H}_{2}\right), 1.24\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH} H_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( 151 MHz , DMSO- $d_{6}$ ) $\delta 161.87,144.96,137.96,134.38,125.02,123.70,119.90,118.84,116.42,79.63,40.53,12.91 ;$ HRMS (ESI) calcd. for $\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}, 323.0780$; found, 323.0782.

### 1.10.5. Synthesis of 3-((1H-1,2,4-triazol-1-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (4a)

Yellow solid, yield: $46.2 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 12.05(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-8-OH), $11.98(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-1-OH), $8.21(\mathrm{~s}, 1 \mathrm{H}$, triazole-5- $H$ ), $8.04(\mathrm{~s}, 1 \mathrm{H}$, triazole-3- $H)$ ), $7.84(\mathrm{~d}, J$ $=7.2 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-H), $7.70(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}$, anthraquinone-6,4-2H), $7.32(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7-H), $7.09\left(\mathrm{~s}, 1 \mathrm{H}\right.$, anthraquinone-2- $H$ ), $5.45\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$ 194.62-188.82, $162.99,152.81,145.98-141.91,137.47,135.29-131.60,124.93,122.89,120.28,118.60,52.67$; HRMS (ESI) cald. for $\mathrm{C}_{17} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}$: 322.0828 ; found, 322.0819 .
1.10.6. Synthesis of 3-((1H-tetrazol-1-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (4b)

Yellow solid, yield: $49.2 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 12.04(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-8-OH), $11.95(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-1-OH), $8.59(\mathrm{~s}, 1 \mathrm{H}$, tetrazole-5- $H$ ), $7.84(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4- $H$ ), $7.77(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-H), $7.70(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-7-H), $7.32(\mathrm{dd}, J=8.5,2.4 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6-H), $7.18\left(\mathrm{~s}, 1 \mathrm{H}\right.$, anthraquinone-2- $H$ ), $5.90\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 161.87$, 144.96, $137.96,134.38,125.02,123.70,119.90,118.84,116.42,55.32$; HRMS (ESI) calcd. for $\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}, 323.0780$; found, 323.0783.

### 1.10.7. Synthesis of 1,8-dihydroxy-3-((5-methyl-1H-tetrazol-1-yl)methyl)anthracene-9,10-dione (4c)

Yellow solid, yield: 42.1\%, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 11.90$ (s, 2H, anthraquinone-1,8-OH), $7.81(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4-H), $7.71(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-5- $H$ ), $7.53(\mathrm{~d}, J=1.3 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6-H), $7.40(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-7-H), $7.22(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2-H), $5.82(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}), 2.55(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( 151 MHz , DMSO- $d_{6}$ ) $\delta 161.89$, 119.89, 49.43, 14.54; HRMS (ESI) calcd. for $\mathrm{C}_{17} \mathrm{H}_{13} \mathrm{~N}_{4} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}$: 337.0937; found, 337.0938.
1.10.8. Synthesis of 3-((1H-benzo[d]imidazol-1-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (5a)

Yellow solid, yield: 61.1\%, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 11.90$ (s, 2H, anthraquinone-1,8-OH), $8.50(\mathrm{~s}, 1 \mathrm{H}$, benzomidazole-2-CH), $7.78(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4-CH), $7.71(\mathrm{~d}, J=7.2 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-CH), $7.67(\mathrm{~s}, 1 \mathrm{H}$, benzomidazole-4-CH), 7.57-7.53 (m, 2 H , anthraquinone-6,7-2CH), $7.37(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2-CH), $7.23\left(\mathrm{dd}, J=8.9,3.4 \mathrm{~Hz}, 3 \mathrm{H}\right.$, benzomidazole-5,6,7-3CH), $5.69\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( 151 MHz ,

DMSO- $d_{6}$ ) $\delta 191.88,181.57,161.89(\mathrm{~d}, ~ J=15.8 \mathrm{~Hz}), 146.02,137.15,125.03,123.43,122.12,119.87,118.78,119.89$, 49.43; HRMS (ESI) calcd. for $\mathrm{C}_{22} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}$: 371.1032; found, 371.1031.

### 1.10.9. Synthesis of 3-((2-ethyl-1H-benzo[d]imidazol-1-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (5b)

Yellow solid, yield: $31.5 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 7.81-7.77(\mathrm{~m}, 1 \mathrm{H}$, anthraquinone-6-H), $7.67(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-H), $7.63(\mathrm{dd}, J=5.2,3.7 \mathrm{~Hz}, 1 \mathrm{H}$, benzoimidazole-4- $H$ ), 7.48 (dd, $J=5.3,3.7 \mathrm{~Hz}, 1 \mathrm{H}$, benzoimidazole-7-H), $7.20(\mathrm{dd}, J=9.0,5.2 \mathrm{~Hz}, 2 \mathrm{H}$, benzoimidazole-5, 6-2H) $6.97(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2-H), $5.68\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 2.74\left(\mathrm{dd}, J=12.2,6.1 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CH}_{3} \mathrm{CH}_{2}\right), 1.30\left(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR (151 MHz, DMSO- $d_{6}$ ) $\delta 191.98,181.67,161.93,147.02,138.15,137.96,125.01,123.49,122.13,119.89,118.78,50.52$, 21.54, 11.81; HRMS (ESI) calcd. for $\mathrm{C}_{24} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}$: 399.1345; found, 399.1346.

### 1.10.10. Synthesis of 3-((5,6-dimethyl-1H-benzo[d]imidazol-1-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (5c)

Yellow solid, yield: $28.8 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 11.90$ (s, 1 H , anthraquinone-8-OH), $11.88(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-1-OH), $8.33(\mathrm{~s}, 1 \mathrm{H}$, benzoimidazole-2- H$), 7.82-7.77(\mathrm{~m}, 1 \mathrm{H}$, anthraquinone-6-H ), $7.68(\mathrm{dd}, J=7.5,1.0 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone- $5-H), 7.52(\mathrm{t}, J=4.4 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7- $H$ ), 7.46 (s, 1H, anthraquinone-4-H), $7.37(\mathrm{~d}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}$, benzoimidazole-4-H), $7.31(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2- $H$ ), $7.16(\mathrm{~d}, J=$ $1.5 \mathrm{~Hz}, 1 \mathrm{H}$, benzoimidazole-7-H), $5.62(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}), 1.26-1.23\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( 151 MHz, DMSO- $\left.d_{6}\right) \delta 191.09$, $180.21,161.46,161.06,144.73,140.89,139.44,136.90,136.10,134.05,132.97,132.25,132.05,131.22,130.46,129.87$, 123.51, 120.64, 118.82, 118.13, 116.67, 114.37, 114.22, 112.95, 108.89, 48.17, 18.92, 18.76; HRMS (ESI) calcd. for $\mathrm{C}_{24} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}: 399.1345$; found, 399.1344 .
1.10.11. Synthesis of 1,8-dihydroxy-3-((5-nitro-1H-benzo[d]imidazol-1-yl)methyl)anthracene-9,10-dione (5d)

Yellow solid, yield: $27.2 \%$, melting point: $>250{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( 600 MHz , DMSO- $d_{6}$ ) $\delta 11.91$ (s, 2H, anthraquinone-1,8-OH), $7.89(\mathrm{~s}, 1 \mathrm{H}$, benzimidazole-5-CH), 7.83-7.80 $(\mathrm{m}, 1 \mathrm{H}$, anthraquinone-5-CH), $7.71(\mathrm{~d}, J=7.4 \mathrm{~Hz}$, 1 H , benzimidazole-7-CH), $7.54(\mathrm{~d}, J=1.2 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-4-CH), $7.40-7.39(\mathrm{~m}, 1 \mathrm{H}$, anthraquinone-6-CH), 7.30 $\left(\mathrm{s}, 1 \mathrm{H}\right.$, benzimidazole-4-CH), $7.18\left(\mathrm{~s}, 1 \mathrm{H}\right.$, anthraquinone-7-CH), $7.00(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2- $\mathrm{C} H), 5.39(\mathrm{~s}, 2 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR (151 MHz, DMSO- $d_{6}$ ) $\delta 192.01,181.76,162.04,161.83,148.28,137.92,134.23,133.77,124.98,122.74,119.88,118.34$, 116.45, 49.39, 21.34; HRMS (ESI) calcd. for $\mathrm{C}_{22} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{6}[\mathrm{M}+\mathrm{H}]^{+}: 416.0883$; found, 416.0886.
1.10.12. Synthesis of 3-((1H-benzo[d][1,2,3]triazol-1-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (5e)

Yellow solid, yield: $22.1 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR $\left(600 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 12.02(\mathrm{~s}, 1 \mathrm{H}, 8-\mathrm{OH}), 11.98(\mathrm{~s}$, 1 H , anthraquinone-1-OH), $7.88(\mathrm{dd}, J=6.6,3.1 \mathrm{~Hz}, 2 \mathrm{H}$, benzotriazole-4,7-2CH), $7.82(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}$, anthraquinone-4,5-CH), $7.68(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6-CH), $7.41(\mathrm{dd}, J=6.6,3.1 \mathrm{~Hz}, 2 \mathrm{H}$, benzotriazole-5,6-2CH), $7.30(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7-CH), $7.17(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2-CH), $5.97(\mathrm{~s}, 2 \mathrm{H}$, $\mathrm{CH}_{2}$ ); ${ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 192.64,181.19,162.88,162.65,144.89,144.53,137.38,134.18,133.47,126.86$,
124.80, 123.34, 120.18, 119.23, 118.20, 115.73, 59.38; HRMS (ESI) calcd. for $\mathrm{C}_{21} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}$: 372.0984; found, 372.0985 .

### 1.10.13. Synthesis of 3-((9H-carbazol-9-yl)methyl)-1,8-dihydroxyanthracene-9,10-dione (6)

Yellow solid, yield: $19.1 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 11.98$ (s, 1 H , anthraquinone-8-OH), $11.95(\mathrm{~s}, 1 \mathrm{H}, \mathrm{H}$, anthraquinone-1-OH), $8.13(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 2 \mathrm{H}$, carbazolyl-4,5-2CH), $7.80(\mathrm{~d}, J=7.5$ $\mathrm{Hz}, 1 \mathrm{H}$, carbazolyl-1,8-2CH ), $7.77(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4-CH), $7.66(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6-CH), $7.44(\mathrm{t}, J$ $=7.7 \mathrm{~Hz}, 2 \mathrm{H}$, carbazolyl-2,7-2CH$), 7.31(\mathrm{~d}, J=8.2 \mathrm{~Hz}, 2 \mathrm{H}$, anthraquinone-5,7-2CH), $7.29(\mathrm{~d}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}$, carbazolyl-1-CH), $7.27\left(\mathrm{~d}, J=7.9 \mathrm{~Hz}, 2 \mathrm{H}\right.$, carbazolyl-3,6-CH), $6.86\left(\mathrm{~s}, 1 \mathrm{H}\right.$, anthraquinone-2-CH), $5.56\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 192.89-190.02,182.50-179.33,162.08-161.37,140.56,138.02-137.62,134.33-133.22$, $130.32-129.75,126.53,125.12-124.55,122.85,122.14-121.43,120.96,118.04-116.91,116.61-112.85,109.90,45.75$; HRMS (ESI) calcd. for $\mathrm{C}_{27} \mathrm{H}_{17} \mathrm{NO}_{4}[\mathrm{M}+\mathrm{H}]^{+}: 420.1236$; found, 420.1233.
1.10.14. Synthesis of 1,8-dihydroxy-3-(((1-methyl-1H-imidazol-2-yl)thio)methyl)anthracene-9,10-dione (7a)

Yellow solid, yield: $51.0 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 11.94(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-8-OH), $11.85(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-1-OH), $7.81(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6- $H$ ), $7.71(\mathrm{~d}, J=7.5 \mathrm{~Hz}$, 1 H , anthraquinone-5-H), $7.63(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4-H), $7.39(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}$, imidazole-5-CH), $7.24(\mathrm{~s}, 1 \mathrm{H}$, imidazole-4-CH), $7.16(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-7-H), $6.98(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2- H$), 4.31(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}), 3.45(\mathrm{~s}, 3 \mathrm{H}$, imidazole $-1-\mathrm{CH}_{3}$ ); ${ }^{13} \mathrm{C}$ NMR ( 151 MHz , DMSO- $d_{6}$ ) $\delta$ 194.32-187.39, 183.70-179.03, 161.79, 151.40-147.41, 137.86, $133.79,129.70,124.57,120.13,115.28,40.57-39.31,37.97$; HRMS (ESI) calcd. for $\mathrm{C}_{19} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}[\mathrm{M}+\mathrm{H}]^{+}: 367.0753$; found, 367.0752.

### 1.10.15. Synthesis of 3-(((4H-1,2,4-triazol-3-yl)thio)methyl)-1,8-dihydroxyanthracene-9,10-dione (7b)

Yellow solid, yield: 43.1\%, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( 600 MHz, DMSO- $d_{6}$ ) $\delta 12.02(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-8-OH), $12.01(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-1-OH), $7.98(\mathrm{~s}, 1 \mathrm{H}$, triazole-1- $H$ ), $7.38(\mathrm{~s}, 1 \mathrm{H}$, triazole-5- $H$ ), $7.26(\mathrm{~d}, J$ $=25.9 \mathrm{~Hz}, 3 \mathrm{H}$, anthraquinone-4,5,6-3H$), 6.95(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-7-H), $6.86(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2-H), $4.19(\mathrm{~s}, 2 \mathrm{H}$, $\left.\mathrm{CH}_{2}\right) ;{ }^{13} \mathrm{C}$ NMR (151 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 164.65-161.79,149.67-145.37,137.36,135.29-132.12,120.21,119.76$, 116.61-114.28, 44.60; HRMS (ESI) calcd. for $\mathrm{C}_{17} \mathrm{H}_{11} \mathrm{~N}_{3} \mathrm{O}_{4} \mathrm{~S}[\mathrm{M}+\mathrm{H}]^{+}$: 354.0549; found, 354.0542.

### 1.10.16. Synthesis of 1,8-dihydroxy-3-(((1-methyl-1H-tetrazol-5-yl)thio)methyl)anthracene-9,10-dione (7c)

Yellow solid, yield: $60.1 \%$, melting point: $>250{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR $\left(600 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 11.92(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-8-OH$)$, $11.94(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-1-OH), $7.87(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-5-H), $7.83(\mathrm{dd}, J=7.5,0.9 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-6-H), $7.70(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-4-H), $7.31(\mathrm{dd}, J=8.4,0.9 \mathrm{~Hz}, 1 \mathrm{H}$, anthraquinone-7-H), $7.26(\mathrm{~s}, 1 \mathrm{H}$, anthraquinone-2- $H$ ), $4.61\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 3.91\left(\mathrm{~s}, 3 \mathrm{H}\right.$, tetrazole-5- $\left.\mathrm{CH}_{3}\right) ;{ }^{13} \mathrm{C}$ NMR ( 151 MHz , DMSO- $d_{6}$ ) $\delta$ 191.90, 181.62, $161.89,144.55,137.95,134.39,133.69,125.03,123.25,119.89,118.47,116.38,31.40,31.11$; HRMS (ESI) calcd. for

${ }^{13} \mathrm{C}$ NMR spectrum of compound $\mathbf{4 b}$

HRMS spectrum of compound $\mathbf{4 b}$

${ }^{1} \mathrm{H}$ NMR spectrum of compound $\mathbf{5 a}$

${ }^{13} \mathrm{C}$ NMR spectrum of compound $\mathbf{5 a}$

HRMS spectrum of compound $\mathbf{5 a}$

${ }^{1}$ H NMR spectrum of compound $\mathbf{5 b}$

${ }^{13} \mathrm{C}$ NMR spectrum of compound $\mathbf{5 b}$

HRMS spectrum of compound $\mathbf{5 b}$

${ }^{1}$ H NMR spectrum of compound $\mathbf{5 c}$

${ }^{13} \mathrm{C}$ NMR spectrum of compound $\mathbf{5 c}$

HRMS spectrum of compound $5 \mathbf{c}$

${ }^{1} \mathrm{H}$ NMR spectrum of compound 6

${ }^{13} \mathrm{C}$ NMR spectrum of compound 6

HRMS spectrum of compound 6

${ }^{1} \mathrm{H}$ NMR spectrum of compound 7 a

${ }^{13} \mathrm{C}$ NMR spectrum of compound $7 \mathbf{a}$

HRMS spectrum of compound 7a
