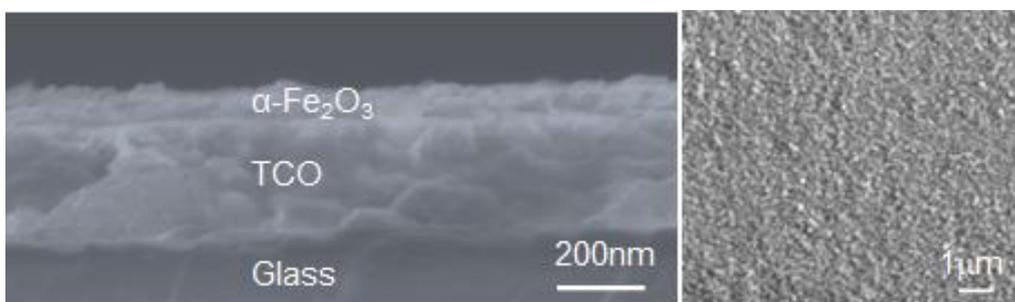

**Figure S1.** Wide-range Raman spectrum of SMART-derived  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> on a glass substrate deposited after 90 cycles.

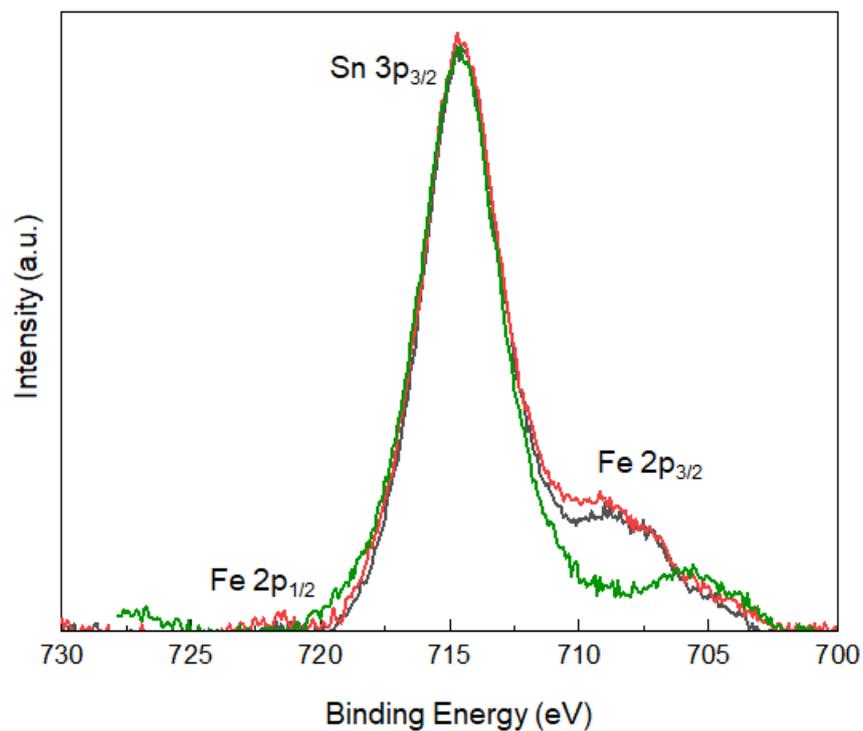

**Figure S2.** Low magnification SEM image of SMART-derived  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> layer on a glass substrate after 90 deposition cycles.

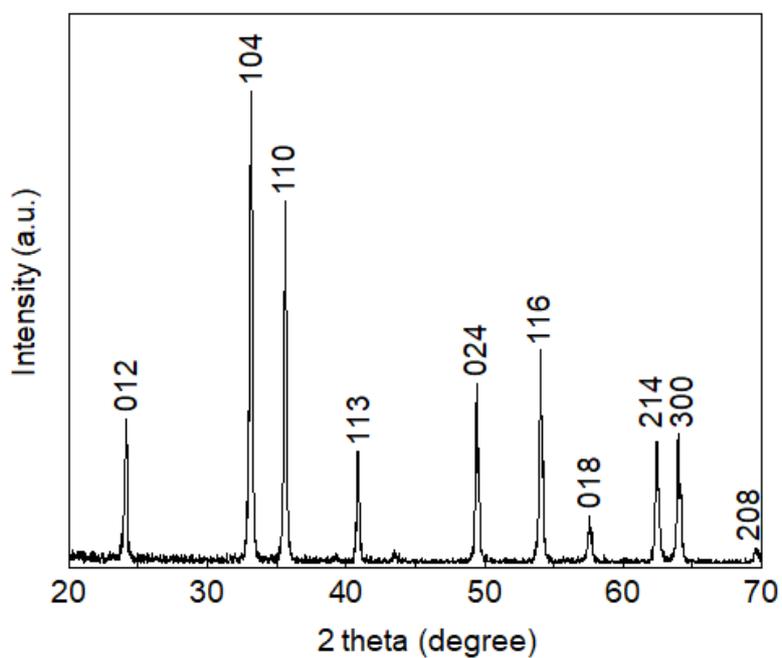

**Figure S3.** UV-vis spectra of SMART-derived  $\alpha\text{-Fe}_2\text{O}_3$  layer on a glass substrate after 30 and 90 deposition cycles.

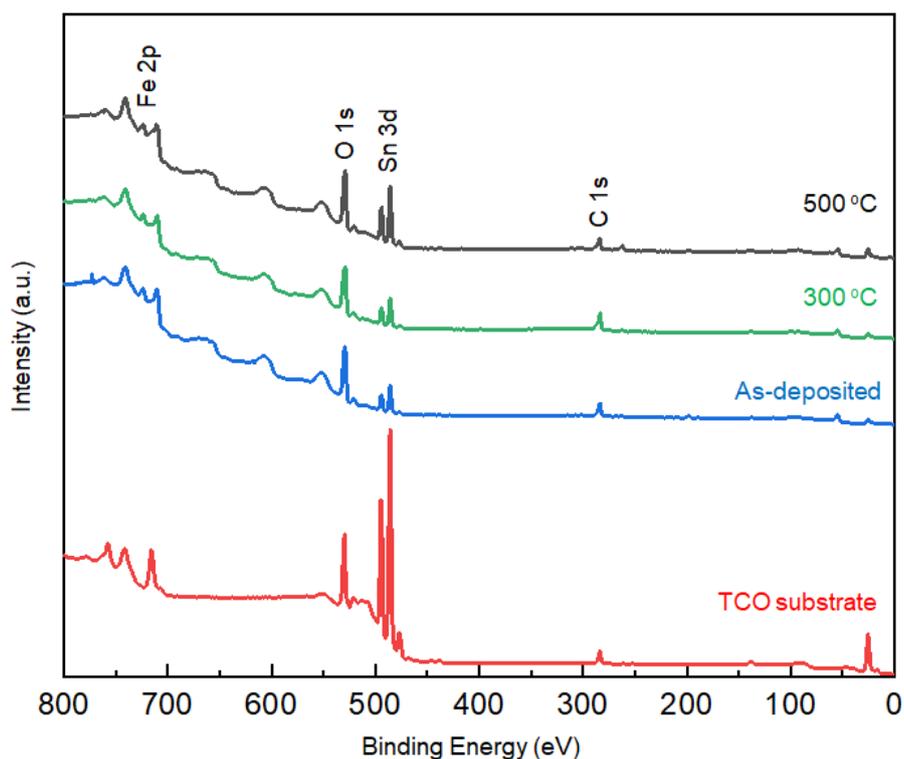

**Figure S4.** SEM images of SMART-derived  $\alpha\text{-Fe}_2\text{O}_3$  on an TCO substrate deposited after 30 cycles.

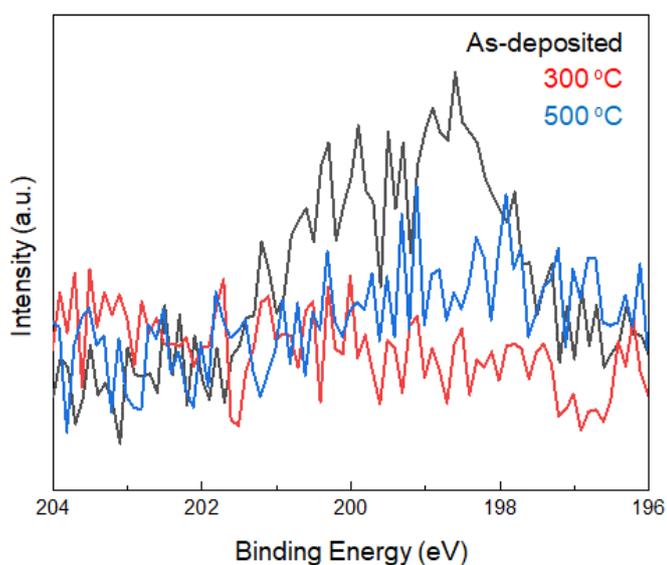

**Figure S5.** As-measured Fe 2p XPS spectra after the first step (black) and second step (red) in the first deposition cycle, and Sn 3p spectra of a bare TCO substrate (green).

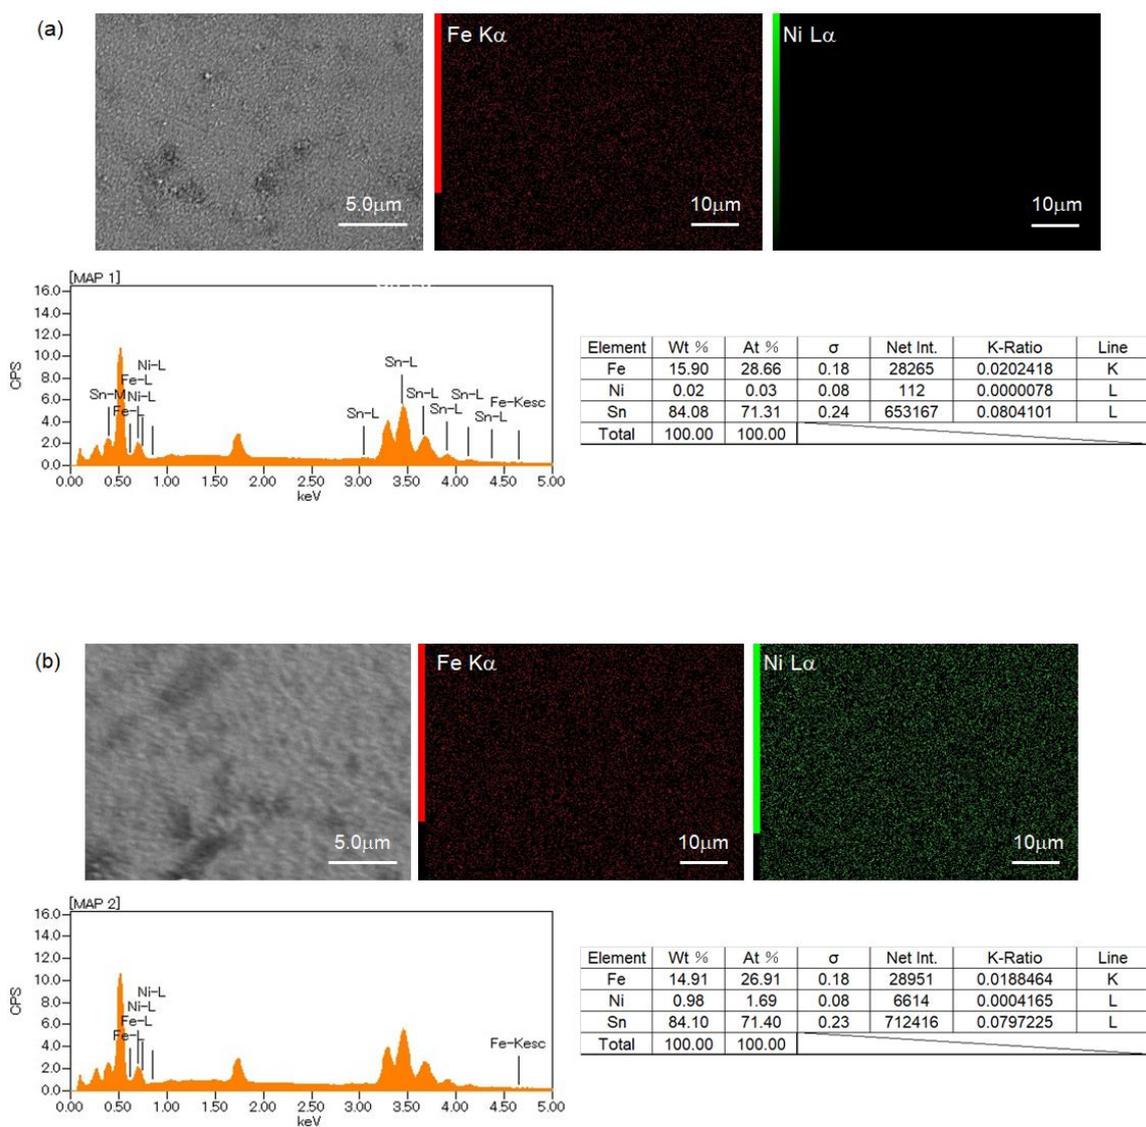

**Figure S6.** XRD pattern of reference  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> powder.

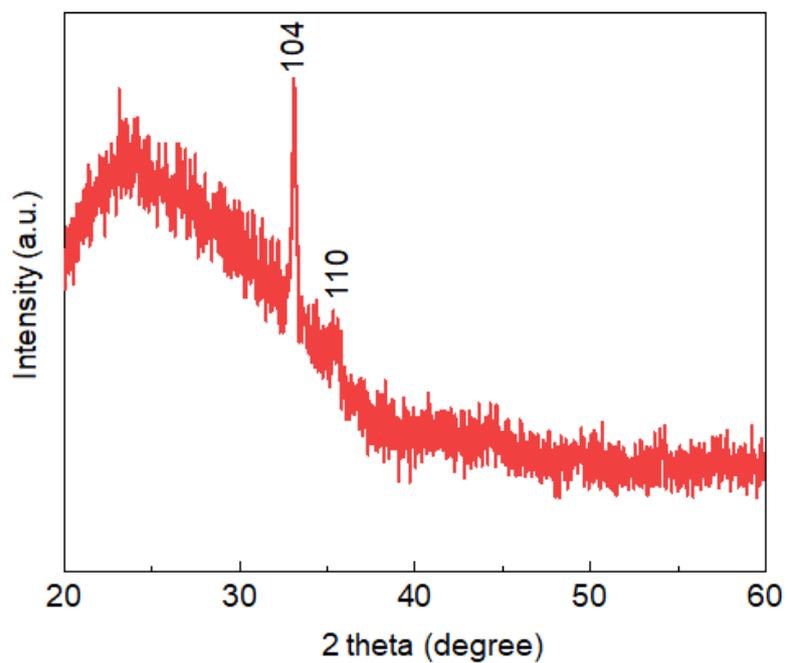

**Figure S7.** Wide-scan XPS spectrum of the SMART-derived  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> deposited on an TCO substrate, as-deposited, and subsequently annealed at 300 °C and 500 °C. Wide-scan XPS spectrum of TCO substrate is shown as a reference.

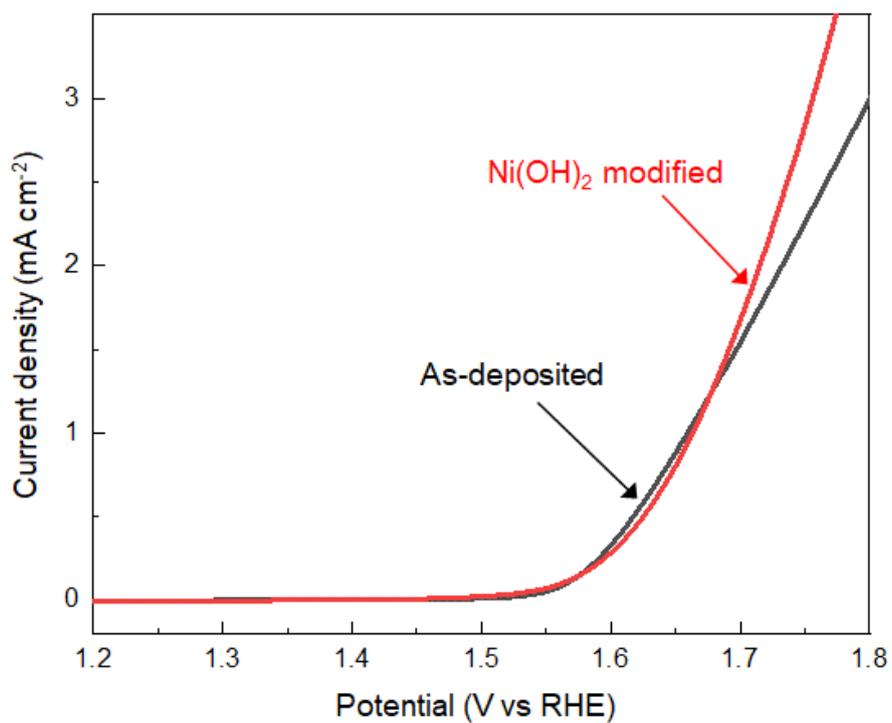

**Figure S8.** C 1s 2p spectra of the SMART-derived  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> deposited on an TCO substrate, as-deposited, and after annealing at 300 °C and 500 °C.

**Figure S9.** SEM images and Fe/Ni distributions obtained by EDS elemental mapping of SMART-derived  $\alpha$ - $\text{Fe}_2\text{O}_3$  (a) before and (b) after  $\text{Ni}(\text{OH})_2$  surface-modification.

**Figure S10.** XRD pattern of the SMART-derived  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> (annealed at 500 °C) after Ni(OH)<sub>2</sub> surface-modification. Note that  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> layer was deposited after 90 cycles.

**Figure S11.** LSV-curves of the SMART-derived  $\alpha$ -Fe<sub>2</sub>O<sub>3</sub> before/after Ni(OH)<sub>2</sub> surface-modification.
