## RHE calibration

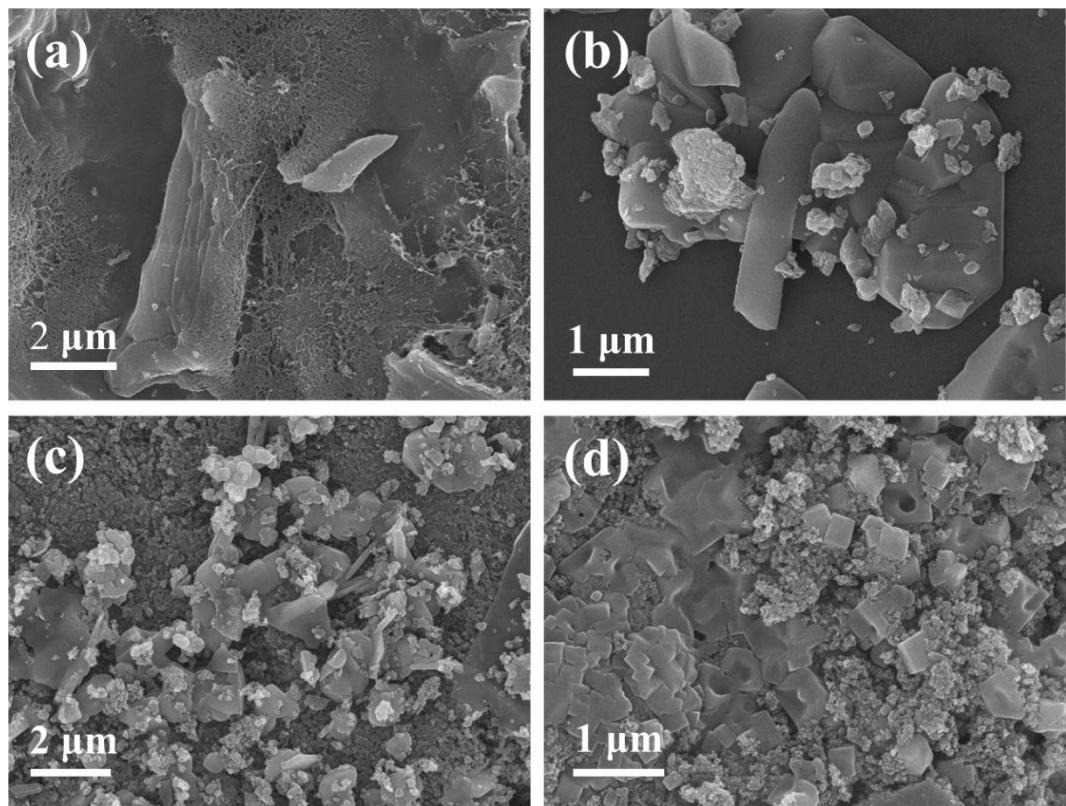

The calibration was performed CV at a scan rate of 5 mV s<sup>-1</sup> in the high purity H<sub>2</sub>-saturated 0.1 M KOH with a Pt plate (1 cm × 1 cm) as a working electrode, Hg/HgO electrode as a reference electrode, and platinum wire as a counter electrode. The average of the two potentials at which the current density equaled zero was taken to be the thermodynamic potential for the hydrogen electrode reactions (Fig. S1),  $E(\text{vs. RHE}) = E(\text{vs. Hg/HgO}) + 0.896 \text{ V}$ .
