Supporting Figure 1

Figure S1: Physicochemical characterization of corona-coated Amphotericin B-intercalated liposomes (AmBisome®). Mean hydrodynamic diameter (nm) and ζ -potential (mV) distributions are depicted for corona-coated liposomal formulation AmBisome® recovered post-incubation with human plasma from 12 healthy volunteers, 7 SIRS patients and 12 sepsis patients.

Supporting Figure 2

Figure S2: Proteomic analysis of corona profiles. (A) Heatmap of normalized abundance values of all corona proteins identified in healthy controls, SIRS patients and sepsis patients, as identified by LC-MS/MS (Progenesis QI). Protein columns are sorted according to the abundance values (from highest to lowest) of the first sample. The list of proteins shown in the heatmap, their respective accession numbers and their mean normalized abundance values are shown in **Table S5**; (B) Volcano plot represents the potential protein biomarkers differentially abundant between healthy donors and sepsis patients ($n=135$) identified in corona samples. Upregulated proteins in sepsis are shown in red ($n=88$), whereas downregulated proteins are shown in dark grey ($n=47$). Only proteins with p value <0.05 are reported. The list of proteins shown in the heatmap and their respective accession numbers, p -values and max fold-change are shown in **Table S6**; (C) Total number of proteins identified per patient by LC-MS/MS analysis of corona samples formed upon the *ex vivo* incubation of AmBisome® liposomes with plasma samples obtained from healthy volunteers, SIRS patients and sepsis patients; * indicates $p<0.05$ ($p=0.0290$), ** indicates $p<0.01$ ($p=0.0030$) using Kruskal-Wallis test.

Supporting Figure 3

Figure S3: Principal component analysis (PCA) of NP-protein corona samples. Scatterplot of the 67 identified in the NP protein corona biomarkers to differentiate sepsis from SIRS in the first two PCA dimensions. SIRS patients are shown in blue, while sepsis patients are shown in red colour. PC1 explained 31% of the variance and PC2 explained 13.5% of the variance. In the PCA biplot shown below runs from each group are close to each other and the two groups appear to form two distinct clusters.
