1. Detailed synthesis of NaLuF₄:20% Pr³⁺ nanoparticles

0.8 mmol LuCl₃•xH₂O and 0.2 mmol PrCl₃•xH₂O were mixed with 6 mL oleic acid and 15 mL 1-octadecene in a 250 mL 3-neck round bottom flask. The solution was stirred at 500 RPM for the duration of the reaction. First, the solution was heated to 120 °C under vacuum and left to stir for 30 minutes. The solution was then cooled to 90 °C, and the vacuum was removed. Solid sodium oleate and solid ammonium fluoride were then added to the solution and left to stir for 45 minutes under an Argon flow. The vacuum was then re-introduced and the solution was degassed at 120 °C for an additional 30 minutes. The vacuum was then removed and an Argon flow was introduced. The solution was then heated to 320 °C (samples 1 and 2) or 330 °C (3 and undoped) at a temperature ramp of 700 °C/hr and stirred for 2 hours. Sample 4 was heated to 310 °C at a rate of 1000 °C/hr and stirred for 2 hours. All samples were precipitated in 99% ethanol and centrifuged at 4000 RPM for 10 minutes to collect a solid white pellet. The supernatant was discarded and the pellet was dispersed in 5 mL hexanes then re-precipitated by adding 40 mL of 99% ethanol. The suspension was then centrifuged again at 4000 RPM for 10 minutes. This process was repeated 3 times to yield purified oleate-capped NaLuF₄: 20% Pr³⁺ and undoped NaLuF₄ nanoparticles. Samples were stored as dried powders at room temperature. The different sizes of nanoparticles were obtained by changing the Na:Ln:F ratio and the reaction temperature, as described by Haase et al. Increasing the amount of Na and F relative to Ln ions is known to decrease the nanoparticle size and favor the formation of hexagonal phase nanoparticles. Samples 1 and 2 were prepared using a ratio of 2.5 mmol Na⁺ : 1 mmol Ln³⁺ : 4 mmol F⁻. Sample 3 and the undoped sample was prepared using a ratio of 6 mmol Na⁺ : 1 mmol Ln³⁺ : 11 mmol F⁻. Sample 4 was prepared using a ratio of 2 mmol Na⁺ : 1 mmol Ln³⁺ : 11 mmol F⁻.

2. Energy dispersive spectroscopy elemental mapping of samples

Figure S1. Energy dispersive spectroscopy elemental mapping of samples 1, 3 and 4 demonstrating the uniformity of Na, Lu, F, and Pr ions within the nanocrystals.
3. Inductively coupled plasma mass spectrometry data

Table S1. Inductively coupled plasma mass spectrometry (ICP-MS) data used to calculate the actual composition of the nanoparticles. ICP-MS was performed in duplicates and values were averaged. Error in the values is limited by the accuracy of the instrument, which is 5% of the raw data values. Sample 3A could not be analyzed due to human error.

4. Photoluminescence emission spectrum

Figure S2 A.) Photoluminescence emission spectrum of sample 4 upon 457.5 nm excitation. B) Camera photo of the luminescence of a dispersion of the nanoparticles in toluene viewed through a 535 nm long pass filter to filter out the excitation light. (pulse energy 33 mJ, pulse width a few ns).
5. Powder X-ray diffraction before and after irradiation

Figure S3. Powder X-ray diffraction of sample 4 before (blue) and after (red) X-ray irradiation (unfiltered, Au anode, 50 kVp, 80 µA).
6. Kinetic profiles of samples 1-4

![Kinetic profiles of samples 1-4](image)

Figure S4. Time-dependent radioluminescence emission kinetics of samples 1-4 plotted as the intensity maximum of the transition vs. time.

Table S2. Experimental, calculated and extrapolated band gap energies of several Ln\(^{3+}\) containing crystals (Ln=Y, La, Gd, Lu) and lowest level of the 4fn-5d1 configuration of Ce\(^{3+}\) (N=1) and Pr\(^{3+}\) (N=2), with respect to the electronic ground state, in NaLnF\(_4\).

8. Radioluminescence before and after persistent luminescence
Figure S5. Radioluminescence emission spectrum of sample 4 before irradiation (black) and immediately after persistent luminescence has ceased (red) (Unfiltered X-ray beam, Au target, 50 kVp, 80 µA).

9. Thermoluminescence data after heating cycles
Figure S6. A) Thermoluminescence glow curves after 3 heating cycles. B) Ratio of emission intensity before/after irradiation of the transitions \( ^4S_0 \rightarrow ^4I_{6g} \) and \( ^3P_0 \rightarrow ^3H_m \) and \( ^3P_0 \rightarrow ^3H_m / ^3D_2 \rightarrow ^3H_m \) transitions illustrating the intensity of the transitions can be recovered after each heating cycle. C) Comparison of the thermoluminescence emission spectrum taken at the glow curve maximum (368 K) and the persistent luminescence emission spectrum. D) Thermoluminescence emission spectra before and after each cycle, illustrating the repeatable change and recovery of intensities before and after irradiation and heating.
