General Experimental

All reagents were purchase from Sigma-Aldrich, TCI, Alfa Aesar, SDFine, SRL, Spectrochem and AVRA chemicals used without further purification unless otherwise stated. For all reactions carried out under inert atmosphere, solvents were dried over activated 4 Å molecular sieves. Silicon oil baths on stirrer hotplates were employed with temperature control *via* thermometer. Reaction progress was monitored by Thin Layer Chromatography (TLC) performed using TLC Silica gel 60 F254. TLC plate's visualization was achieved by a combination of ultraviolet light (254 nm), potassium permanganate solution, iodine treatment or *p*-anisaldehyde stains. Flash column chromatography was performed using silica gel (100-200 mesh) as a stationary phase with suitable mobile phase. Generally, all reactions performed in oven-dried glassware under a nitrogen atmosphere unless otherwise stated.

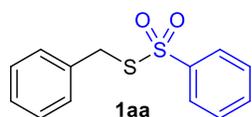

Melting points were measured in open capillaries using DBK digital melting point apparatus and are uncorrected. ¹H- and ¹³C NMR's were recorded using Bruker AVIII400 (¹H = 400 MHz, ¹³C = 101 MHz) with the spectrometers at 300 K. Chemical shifts (δ) are given in ppm relative to TMS and coupling constants (*J*) are quoted in Hz to one decimal place. For spectra recorded in chloroform-*d* (CDCl₃) the δ 7.26 ppm resonance of residual CHCl₃ for proton spectra and δ 77.16 ppm resonance of CDCl₃ for carbon spectra were used as internal references. Spectral data for ¹H NMR spectroscopy is reported as follows: Chemical shift (multiplicity, coupling constant, number of protons) and the following abbreviations were used for multiplicity in ¹H NMR: *s* (singlet), *d* (doublet), *t* (triplet), *q* (quadruplet), *dd* (doublet of doublets), *dt* (doublet of triplets), *td* (triplet of doublets), *quin* (quintuplet), *bs* (broad singlet), *m* (multiplet), *app.*(apparent). ¹³CNMR spectroscopy is reported as chemical shift values. All NMR spectrums are processed using *MestReNova version 6.0.2(v)*. High resolution mass spectroscopy (HRMS) were recorded using ESI with a time of flight analyser (TOF) techniques and was obtained using a lock-mass to adjust the calibrated mass scale.

XRD experiments by measuring X-ray intensity data on a Bruker SMART APEX III single crystal X-ray CCD diffractometer having graphite-monochromatised (Mo-K α = 0.71073 Å) radiation at low temperature (100K). The X-ray generator was operated at 50 Kv and 30 mA. A preliminary sets of cell constant and an orientation matrix were calculated from total 36 frames. The optimized strategy used for data collection consisted different sets of ϕ and ω scans with 0.5° steps ϕ/ω . Data were collected with a time frame of 10 secs for all the components by keeping the sample to detector distance fixed at 40 cm. All the data's were corrected for Lorentzian, polarization and absorption effects using SAINT and SADABS programs (Bruker, 2016). SHELX-97 was used for structure solution and full matrix least-squares refinement on F2 with anisotropic displacement parameters for non-H atoms. Hydrogen atoms associated with carbon atoms were fixed in geometrically constrained positions. While the hydrogen atoms associated with oxygen and nitrogen atoms were included in the located positions. The ORTEP diagram was generated by using the X-seed software package version 2.0.

General Procedure-1 (GP1) for synthesis of benzyl thiosulfonates:

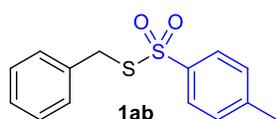

According to known procedure the corresponding sodium thiosulfonates¹ were prepared. A heat gun-dried round bottom flask was charged sodium benzenesulfonothioate or sodium 4-methylbenzenesulfonothioate (2.0 mmol, 1.0 equiv) and benzyl bromide derivatives (3.0 mmol, 1.5 equiv) in CH₃CN (10 mL). The reaction mixture was stirred at room temperature for 16 h under nitrogen atmosphere and monitored by TLC either complete or appeared to be proceeding no further progress. The mixture was quenched by addition of water (30 mL) followed by extraction with EtOAc (3x50 mL). The combined organic layers were washed with brine (2x30 mL), dried over anhydrous Na₂SO₄ and the solvent was removed under reduced pressure. The resulting residue was subjected to flash chromatography (silica gel, eluted with 5% to 10% ethyl acetate/petether) to afford desired benzyl thiosulfonates.

General Procedure-2 (GP2) for synthesis of benzyl thiosulfonates:

This procedure was slightly modified as reported in literature.⁷ A heat gun-dried round bottom flask was charged arylsulfonyl chloride (2.0 mmol, 1.0 equiv) and sodium sulfide (Na₂S, 2.0 mmol, 1.0 equiv) in ethanol (10 mL) at 0 °C under nitrogen atmosphere. To this stirred solution, Et₃N (2.0 mL) was added drop-wise and the reaction mixture allowed to stir at room temperature for 16 h. The reaction was monitored by TLC the formation of sodium benzenesulfonylthioate. The solvent was evaporated under reduced pressure and the crude sodium arylsulfonylthioate was dissolved in CH₃CN (10 mL). The benzyl bromide (3.0 mmol, 1.5 equiv) added and the mixture was stirred at room temperature for 16 h under nitrogen atmosphere and monitored by TLC either complete or appeared to be proceeding no further progress. The mixture was quenched by addition of water (30 mL) followed by extraction with EtOAc (3x50 mL). The combined organic layers were washed with brine (2x30 mL), dried over anhydrous Na₂SO₄ and the solvent was removed under reduced pressure. The resulting residue was subjected to flash chromatography (silica gel, eluted with 5% to 10% ethyl acetate/petether) to afford desired benzyl thiosulfonates.

General Procedure-3 (GP3) for synthesis of benzyl dithiosulfones:

A heat gun-dried Schlenk tube was charged benzyl thiosulfonates **1(a-j,m,o)a**, **1(a-c,k,n)b** and **1a(a-l)** (0.5 mmol, 1.0 equiv), phenylboronic acid (0.1 mmol, 0.2 equiv, 20 mol%) and K_2CO_3 (0.5 mmol, 1 equiv) in chlorobenzene (2.5 mL). The reaction mixture was stirred at 90 °C for 3 h and monitored by TLC either complete or appeared to be proceeding no further progress. The mixture was quenched by addition of water (20 mL) followed by extraction with EtOAc (3x30 mL). The combined organic layers were washed with brine (2x30 mL), dried over anhydrous Na_2SO_4 and the solvent was removed under reduced pressure. The resulting residue was subjected to flash chromatography (silica gel, eluted with 10% to 15% ethyl acetate/petether) to afford desired benzyl sulfonodisulfane **2** derivatives.
