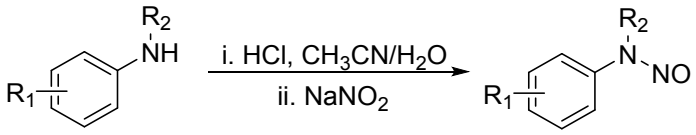
1. General information and materials

Reagent: All the reactions were carried out under inert atmosphere. All the solvents used for the reactions were dried according to standard procedures. All commercial materials were used as received unless otherwise noted. $[Cp^*RhCl_2]_2$, Ag_2O, $Cu(OAc)_2$, were used in Rh-catalyzed reactions. The starting materials N-nitrosoanilines [1], sulfoxonium ylides[2] and [D5]-N-nitrosoanilines [3] were prepared according to the reported procedure. All the reactions were monitored by thin layer chromatography (TLC, Silica gel Merck 60 F 254); The spots were visualized by UV light. Purification of products was conducted by flash chromatography on silica gel.

Instruments: NMR spectra were recorded on Bruker Ultrashield™ 400 MHz. Chemical shifts were given relative to $CDCl_3$ (7.26 ppm for ^1H NMR, 77.00 ppm for ^{13}C NMR). For the characterization of the observed signal multiplicities, the following abbreviations were applied: s (singlet), d (doublet), dd (double doublet), t (triplet), td (triple doublet), q (quartet), m (multiplet), as well as br (broad); High resolution ESI mass experiments were operated on a Bruker Daltonics, Inc. APEXIII 7.0 TESLA FTMS instrument.

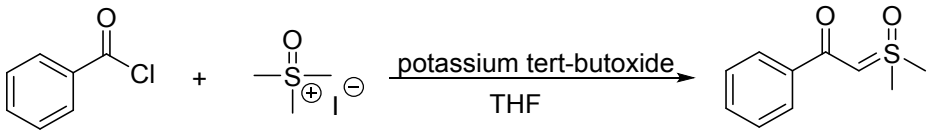
2. Synthesis of Substrates

2.1 General procedure for preparation of N-nitroso aniline substrates[1]



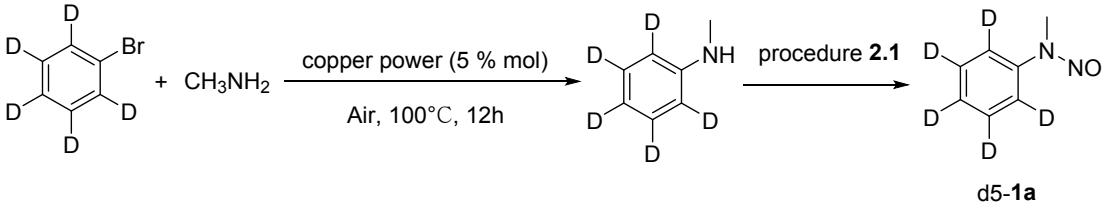
The aniline (0.05 mol, 1.0 equiv) was dissolved in a 1:2 mixture of acetonitrile and water (30.0 mL) and cooled to 0 °C (ice bath). Concentrated aqueous HCl (7.3 mL, 0.24 mol) was added dropwise. The mixture was stirred vigorously for half an hour, while maintained at 0 °C. To this mixture was added an aqueous solution (13.0 mL) of $NaNO_2$ (3.5 g, 0.05 mol) over the course of 10 min. The reaction was allowed to proceed for 1h. The mixture was then extracted with EtOAc. The combined organic layer was washed with brine, dried over Na_2SO_4, concentrated under reduced pressure, and purified by flash silica gel column chromatography (petroleum ether / ethyl acetate = 20:1) to give the corresponding N-nitroso aniline substrates **1**.

2.2 General procedure for preparation of sulfoxonium ylides[2]



In a 250 mL flame-dried round bottom flask attached to a reflux condenser, under argon atmosphere, 6.0 g of potassium tert-butanolate (54.4 mmol, 4.0 equiv) and 60.0 mL of anhydrous THF was added. Then, 8.9 g of trimethylsulfoxonium iodide (40.8 mmol, 3.0 equiv) was added in one portion. The suspension was heated at reflux and maintained for 2 hours. After this time, the mixture was cooled to 0 °C, followed by slow addition of a 1.0 M solution of the benzoyl chlorides (13.6 mmol, 1.0 equiv) in anhydrous THF. The reaction mixture was allowed to warm to room temperature and stirred for additional 3 hours. Next, the solvent was removed on a rotary evaporator, 15.0 mL of water was added and the product extracted with EtOAc (3 ×50 mL). The organic phase was washed with saturated NaCl solution (2 ×10 mL) and dried over with Na_2SO_4. The crude product was purified by recrystallization with EtOAc.

2.3 General procedure for preparation of [D5]-N-nitrosoanilines[3]



Bromobenzene-d 5 (5 mmol, 0.805 g), 30 % aqueous methylamine solution (2.7 mL,

25 mmol), copper power (0.016 g, 5 mol %) was combined in a 30 mL screwed sealed tube and placed in an oil bath under Air atmosphere. The reaction mixture was magnetically stirred and heated to 100 °C for 12 h. When the reaction completed or underwent to the time, the reaction mixture was cooled to room temperature and ethyl acetate (20 mL) was added to extract the d5 -1a. The organic layer was separated and the aqueous layer was extracted by ethyl acetate (3×10 mL). The combined organic phase was washed with brine and dried over Mg_2SO_4. The organic layer was evaporated in vacuum and the crude product was purified by flash column chromatography (Petroleum ether /EtOAc = 10:1) to give **d5 -1a**.
