### Content

**Figure S1 and S2.** Difference IR spectra of SP-Nitro@MIL-68(In) and SP-Nitro@MIL-68(Ga) focusing on the irradiation time with MC IR bands with maximum intensity.

**Figure S3 and S4.** Difference IR spectra of SP-Nitro@MIL-68(In) and SP-Nitro@MIL-68(Ga) exceeding the irradiation time with MC IR bands with maximum intensity.

**Figure S5 and S6.** Difference IR spectra of SP-Nitro@MIL-68(In) and SP-Nitro@MIL-68(Ga) focusing on increasing and decreasing IR bands after long time irradiation with UV light.

**Figure S7 to S10** IR spectra of SP-Nitro@MIL-68(In) and SP-Nitro@MIL-68(Ga) after prolonged UV light irradiation, followed by a) photochemical and b) thermal treatment to induce the re-conversion to the initial state.

**Table S1 to S4.** Assignment of decreasing and increasing IR bands of SP-Nitro@MIL-68(In) and SP-Nitro@MIL-68(Ga).

**Figure S1.** Difference IR spectra of SP-Nitro@MIL-68(In) under irradiation with UV light ( $\lambda = 365$  nm). The green line shows the spectrum, for which the maximum intensity of MC bands was observed (60 min irradiation time).

**Figure S2.** Difference IR spectra of SP-Nitro@MIL-68(Ga) under irradiation with UV light ( $\lambda = 365$  nm). The green line shows the spectrum, for which the maximum intensity of MC bands was observed (90 min irradiation time).

**Figure S3.** Difference IR spectra of SP-Nitro@MIL-68(In) under irradiation with UV light ( $\lambda = 365$  nm) for 60 min to 1000 min. The green line shows the spectrum, for which the maximum intensity of MC bands was observed (60 min irradiation time), the orange line corresponds to an irradiation time of 1000 min. Decreasing MC bands are marked with an arrow, whereas new increasing IR bands are labeled with an asterisk.

**Figure S4.** Difference IR spectra of SP-Nitro@MIL-68(Ga) under irradiation with UV light ( $\lambda = 365$  nm) for 90 min to 210 min. The green line shows the spectrum, for which the maximum intensity of MC bands was observed (90 min irradiation time), the orange line corresponds to an irradiation time of 210 min. Decreasing MC bands are marked with an arrow, whereas new increasing IR bands are labeled with an asterisk.

**Figure S5.** Difference IR spectrum of SP-Nitro@MIL-68(In) after irradiation with UV light (365 nm, 1000 min) after subtracting the difference spectrum obtained after 60 min UV light exposure.

**Figure S6.** Difference IR spectrum of SP-Nitro@MIL-68(Ga) after irradiation with UV light (365 nm, 210 min) after subtracting the difference spectrum obtained after 90 min UV light exposure.

**Figure S7.** Light excitation of SP-Nitro@MIL-68(In) with different wavelengths to induce re-conversion to the ground state.

**Figure S8.** Heat treatment of SP-Nitro@MIL-68(In) at 50 °C for different times to induce the re-conversion to the initial state thermally.

**Figure S9.** Light excitation of SP-Nitro@MIL-68(Ga) with different wavelengths to induce re-conversion to the ground state.

**Figure S10.** Heat treatment of SP-Nitro@MIL-68(Ga) at 50 °C for different times to induce the re-conversion to the initial state thermally.

**Table S1.** Observed decreasing IR bands of SP-Nitro@MIL-68(In). The given assignment is based on the experimental and calculated (“\*”) data of *Nakata* and co-workers<sup>[50]</sup>. Modes of vibration were attributed according to *Lyubimov* and co-workers<sup>[53]</sup>, *Paal* and *Arnold*<sup>[54]</sup> and *Hesse, Meyer & Zeeh*<sup>[55]</sup>.
