1. General Information for characterization and measurements

All chemicals were purchased from commercial suppliers (Sinopharm Chemical Reagent Co.) and used without further purification, unless otherwise noted. The monomer of were synthesized by modifying the reported methods¹. Solution ¹H-NMR spectra were taken by Varian Mercury-400 MHz (¹H at 400 MHz, ¹³C at 100 MHz). 2D ¹H DOSY-NMR spectra were taken by Varian Mercury-400 MHz under constant temperature of 20 °C. The pulse sequence named 'Dbppste' was used for DOSY experiment with parameters as 'ss=-8', 'il='y'', 'bs=4', delflag='y', del=0.15s and gt1=0.004s. The concentration of the test samples was maintained at 1 mg/0.4ml, *N,N*-Dimethylformamide-*d*7 and Chloroform-*d* were used as solvent. Diffusion coefficients (*D*) of polystyrene samples with known molecular weights (*M_w*) were obtained by DOSY. Thus, linear relationship between diffusion coefficients and molecular weights was fitted and calculated as $\text{Lg}(D) = -0.5900 \cdot \text{Lg}(M_w) - 3.4411$ and $\text{Lg}(D) = -0.5344 \cdot \text{Lg}(M_w) - 3.2315$. The diffusion coefficient of endo-PNBNPE, exo-PNBNPE and L-Azo-POP were measured by DOSY. And its molecular weight (*M_w*) was calculated through the linear relationship between diffusion coefficients and molecular weights. Solid-state cross-polarization magic angle spinning (CP-MAS) ¹³C-NMR spectra of solid samples were obtained using a Bruker Avance III 600 MHz Wide Bore spectrometer (14.2 T). A 4 mm MAS probe and ZrO₂ motor were used, and spin rates at 151 MHz. Infrared spectra were recorded on a PerkinElmer Spectrum Two Fourier transform spectrometer. Elemental analysis was measured in the analytical instrumentation center of Beijing University, Beijing China, by using Elementar Vario EL CUBE. Thermogravimetric analysis (TGA) was carried out on a Q600 SDT (TA, US) thermogravimetric analyzer, heated from 25 °C to 800 °C at a rate of 10 °C/minute under N₂ atmosphere. Solution UV-vis spectra were recorded on a Milton Roy Spectronic 3000 Array spectrophotometer. The morphologies of polymers were studied using a Hitachi S4800 scanning electron microscope (SEM) and FEIT Tecnai G2 F30 transmission electron microscope (TEM) working at 300 kV. N₂ adsorption/desorption studies were carried out at 77K using the BELSORP-MAX-II (BEL, Japan, Inc., Japan). BET surface area and pore volume were obtained by Brunauer-Emmett-Teller (BET) method between the pressure of 0.05-0.35 P/P₀. Polymer pore size distributions were calculated from the adsorption branches using non-local density functional theory (NLDFT) methods.

To obtain the binding energies to understand the selective adsorption towards 4-NP over 4-AP, various complexes between model compounds (see Table S10) and 4-nitrophenol (4-NP) /4-aminophenol (4-AP) were optimized. Many initial

configurations were tested and the optimized ones with the lowest energies (see Figure S30) were taken into the calculations of binding energies.

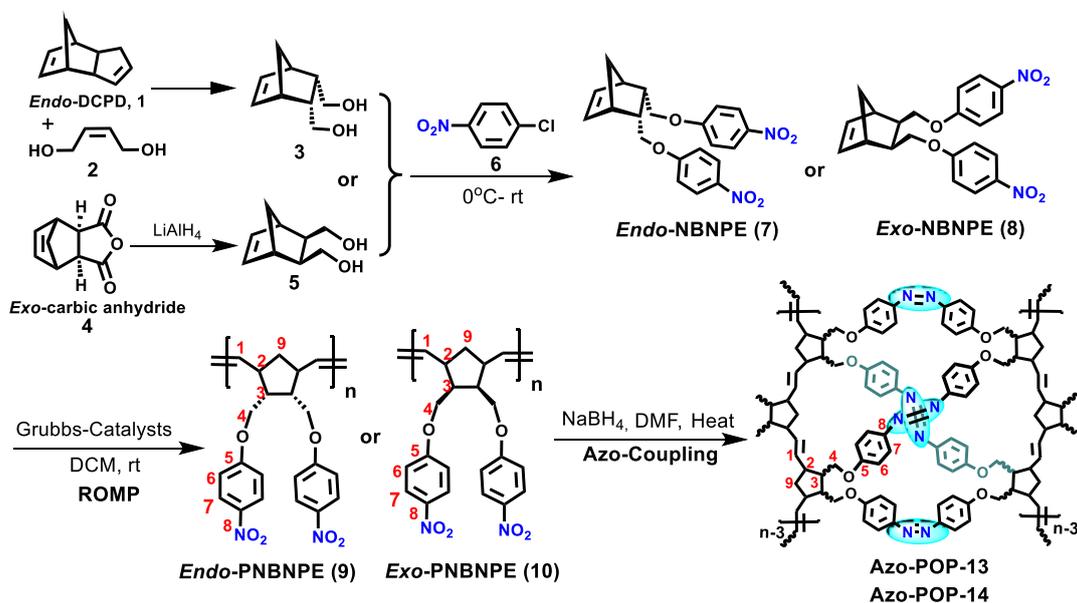

All calculations presented in this paper were performed using density functional theory (DFT) with the hybrid functional B3LYP¹⁻³ as implemented in Gaussian 09 package.⁴ Geometry optimizations were carried out with the 6-31G(d,p) basis set. On the basis of the optimized geometries, more accurate energies were obtained by performing single-point calculations with a larger 6-311+G (2d,2p) basis set. Using an empirical formula by Grimme et al.,⁵⁻⁸ dispersion effects were taken into account throughout geometry optimizations and single-point calculations. Frequency calculations were performed at the same level of theory as in the optimizations to further confirm the nature of stationary points and to obtain zero-point energies (ZPE). The binding energies reported in this paper (given in Table S10) have been corrected for dispersion and ZPE effects.

2. General Synthetic Procedures

The monomers *endo*-NBNPE (7), *exo*-NBNPE (8), linear polymers *endo*-PNBNPE (9) *exo*-PNBNPE (10), Azo-POP-13 and Azo-POP-14 were synthesized by the following scheme.

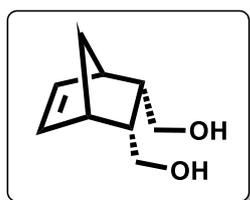

Scheme 1. The synthetic routes for Azo-POP-13 and Azo-POP-14

2.1 Synthesis of Azo-POP-13

2.1.1 Synthesis of *endo*-norbornene-dimethanol (3)

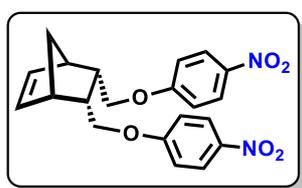

According to the previous reported synthetic procedure¹: The dicyclopentadiene **1** (DCPD, 30 mL, 0.35 mol) was heated at 200 °C to give fresh cyclopentadiene (25 mL, 0.30 mol), which was mixed with *cis*-1,4-but-2-ene-diol **2** (18 mL, 0.2 mol) in a 250 mL of sealed tube. The whole mixture was heated at 210 °C (heating block) for 6 h. Upon cooling, the crystalline (14 g, 45%) was filtered off, the filtrate was dissolved in hot water (100 ml, 80 °C) and separated with funnel. The aqueous phase was dried on vacuum and heating, upon cooling, another crystalline (7.0 g, 23%) was obtained, with a total isolated yield of 68%.

¹H NMR (400 MHz, CDCl₃) δ (ppm): 6.00 (t, *J* = 1.9 Hz, 2H), 4.27 (d, *J* = 4.5 Hz, 2H), 3.58 (dd, *J* = 9.6, 5.8 Hz, 2H), 3.32 (t, *J* = 10.4 Hz, 2H), 2.76 (h, *J* = 1.8 Hz, 2H), 2.55 – 2.40 (m, 2H), 1.36 (qt, *J* = 8.2, 1.7 Hz, 2H).

2.1.2 Synthesis of *endo*-NBNPE (7)

To a solution of *endo*-norbornene-dimethanol **3** (6.2 g, 40 mmol, 1.0 equiv.) in DMF (300 mL) were slowly added NaH (60 wt%, 3.4 g, 84 mmol, 2.1equiv.) in the ice bath, and continue to stir for about 30min. Then 4-chloronitrobenzene **6** (15.6 g, 100 mmol, 2.5 equiv.) was added to above mixtures. The reaction mixture was stirred at room temperature overnight, then the reaction was quenched and diluted with ice-water. The crude material was poured into 400 mL of H₂O/EtOH (2: 1) to afford the title *endo*-NBNPE **7** as a precipitate, which was filtered, washed with water, and dried (13.8 g, 87%).

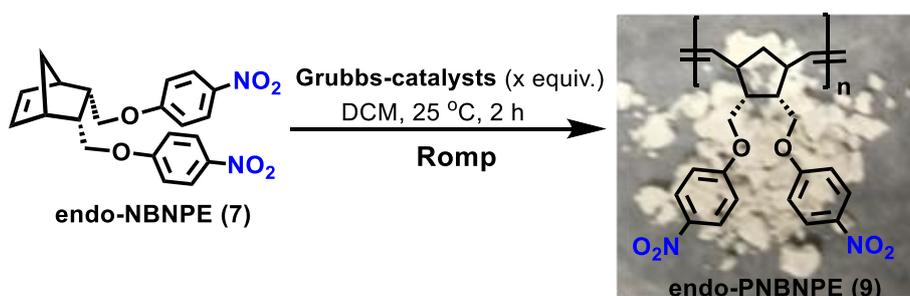

¹H NMR (400 MHz, CDCl₃) δ (ppm): 8.29 – 8.05 (m, 4H), 7.01 – 6.78 (m, 4H), 6.23 (t, *J* = 1.9 Hz, 2H), 4.01 – 3.91 (m, 2H), 3.80 (ddd, *J* = 9.2, 6.6, 2.2 Hz, 2H), 3.11 (p, *J* = 1.7 Hz, 2H), 2.84 (q, *J* = 6.3, 4.6 Hz, 2H), 1.64 (dt, *J* = 8.5, 2.0 Hz, 1H), 1.49 (dt, *J* = 8.5, 1.5 Hz, 1H); ¹³C NMR (100 MHz, CDCl₃) δ (ppm): 163.5, 141.3, 135.4, 125.7, 114.1, 68.8, 49.2, 45.4, 40.9.

2.1.3 Synthesis of *endo*-PNBNPE (9)

Scheme 2. ROMP for Synthesis of *endo*-PNBNPE (9)

The synthetic procedure: To a solution of *endo*-NBNPE (**7**, 12.0 g, 30 mmol, 1.0 equiv.) in DCM (300 mL) were added Grubbs-II (240 mg, 0.3 mmol, 0.01 equiv.) and stirred at room temperature about 2 hours, and then ethyl vinyl ether (1 mL, excess) was added to above solution. The reaction mixture was stirred for further 30min, and the mixture was dissolved in hot DMF (300 mL, 80°C). The above solution poured into 500 mL of water to yield a white precipitate, which was filtered, washed with water, and freeze-dried for *endo*-PNBNPE (**9**, 11.8 g, 96% yield).

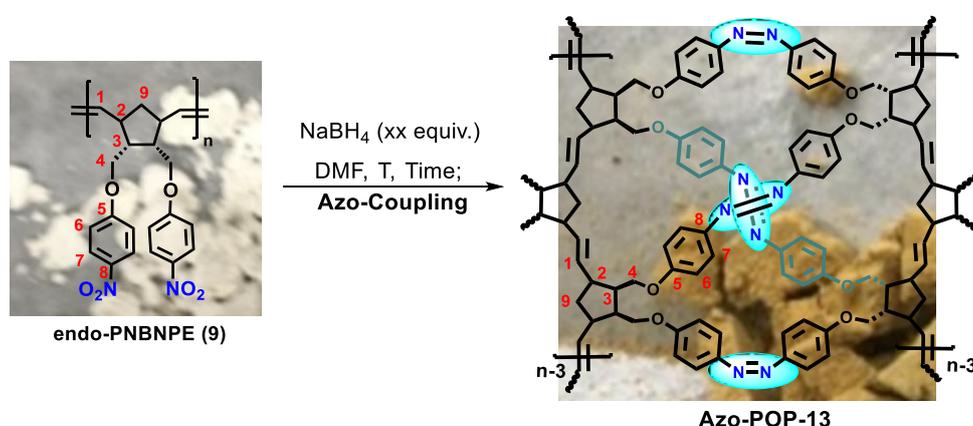

^1H NMR (400 MHz, DMF- d_7) δ (ppm): 8.34 – 8.07 (m, 4H), 7.33 – 7.09 (m, 4H), 5.98 – 5.60 (m, 2H), 4.37 (m, 4H), 3.69 (m, 2H), 3.14 – 2.73 (m, 2H), 2.46 – 2.07 (m, 1H), 1.75 (s, 1H); ^{13}C NMR (100 MHz, DMF- d_7) δ (ppm): 164.2, 141.3, 132.4, 125.9, 114.9, 67.8, 45.4, 40.2, 38.5.

2.1.4 Synthesis of Azo-POP-13

Scheme 3. Synthesis of Azo-POP-13 by azo-coupling polymerization

The Synthetic Procedure: To a solution of *endo*-PNBNPE (**9**, 4 g, 1.0 equiv.) in DMF (150 mL) was added a solution of NaBH_4 (7.6 g, 10 equiv.) in DMF (50 mL) dropwise in 15 min. The resulting mixture was stirred for about 6 hours. The resulting solid was filtered, washed with hot DMF (50-100 mL) and 100 mL of H_2O , and then dried via lyophilization to give **Azo-POP-13** (3.4 g, 86% yield).

^{13}C CP/MS NMR, δ (ppm): 160.6, 152.1, 147.5, 132.9, 114.9, 68.5, 43.6, 32.4.

Elemental Analysis: C (72.98%), N (7.15%), H (6.95%).

2.2 Synthesis of Azo-POP-14

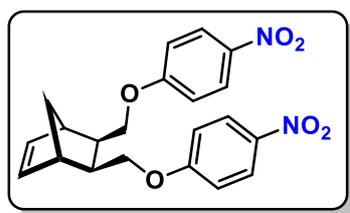

2.2.1 Synthesis of *exo*-norbornene-dimethanol (**5**)

According to the previous reported synthetic procedure ²: To a solution of *exo*-carbonyl anhydride **4** (1.64 g, 10 mmol, 1.0 equiv.) in THF (50 mL) were added LiAlH_4 (1.2 g, 30 mmol, 3 equiv.) under the ice bath, stirred about 30 min, and the reaction mixture

was stirred for 12 hours at room temperature. The reaction mixture was cooled into ice bath, quenched with 2mL of ice-water and 10%NaOH (aq). The filtrate was removed by distillation under reduced pressure, after the mixture was dissolved in AcOEt (3 x 50 mL) and brine (15 mL), The organic phase was dried with MgSO₄, and then removed the AcOEt to afford the desired product (**5**, 1.2 g) without purified.

2.2.2 Synthesis of *exo*-NBNPE (**8**)

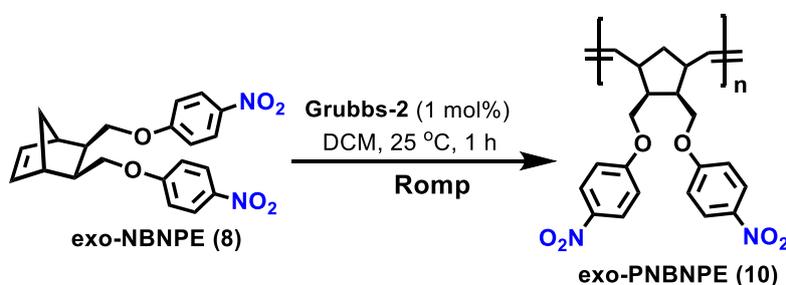

To a solution of *exo*-norbornene-dimethanol **5** (1.3 g, 8.8 mmol, 1.0 equiv.) prepared above in DMF (50 mL) were added NaH (0.8 g, 18.5 mmol, 2.1 equiv.) under the ice bath, stirred about 30min, and then compound **6** (3.45 g, 22 mmol, 2.5 equiv.) was added to above solution. The reaction mixture was stirred for 12 hours at room temperature and cooled to room temperature, diluted and washed with ice-water. The crude material was poured into 100ml of H₂O/ EtOH (1:1) to yield a precipitate, which was filtered, washed with water, and dried for *exo*-NBNPE (**8**, 3.1g).

Scheme 4. ROMP for Synthesis of *exo*-PNBNPE (**10**)

The synthetic procedure: To a solution of *exo*-NBNPE (**8**, 12.0 g, 30 mmol, 1.0 equiv.) in DCM (300 mL) were added Grubbs-II (240 mg, 0.3 mmol, 0.01 equiv.) and

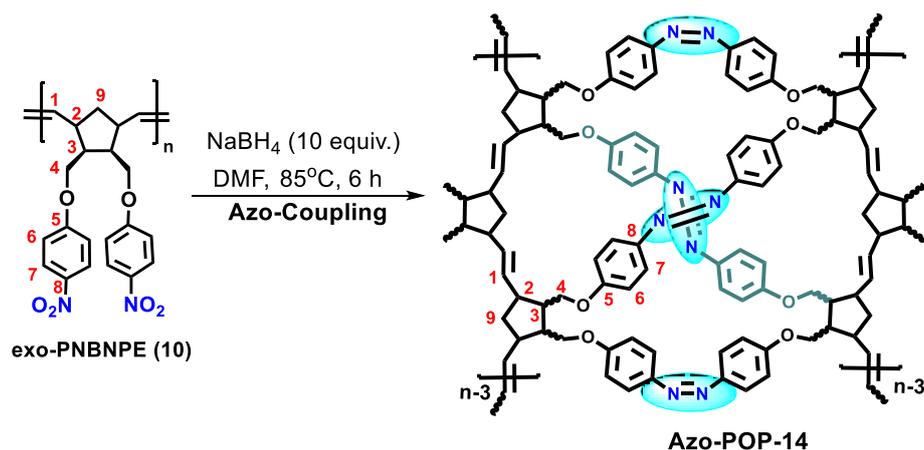

stirred at room temperature about 1 hours, and then ethyl vinyl ether (1 mL, excess) was added to above solution. The reaction mixture was stirred for further 30min, and the mixture was dissolved in hot DMF (300 mL, 80°C). The above solution poured into 500 mL of water to yield a white precipitate, which was filtered, washed with water, and freeze-dried for *exo*-PNBNPE (**10**, 11.9 g, 98% yield).

2D ¹H DOSY-NMR (CDCl₃): molecular weight (*M_w*) = 9400 g.mol⁻¹ (DMF); molecular weight (*M_w*) = 4000 g.mol⁻¹ (DMSO).

2.3.2 ROMP on the Linear Azo-polymer

To a solution of *L*-Azo-POP (40 mg) in CDCl₃ (2 mL) were added Grubbs-I (4.0 mg.), and Grubbs-II (4.0 mg.) respectively at room temperature. The mixture was stirred about 24 hours. The progress of the reaction was monitored by ¹H NMR. Unfortunately, the *L*-Azo-POP remained unchanged.

3 Selective Adsorption of 4-Nitrophenol

3.1 Azo-POP-13 for Selective Adsorption of 4-Nitrophenol

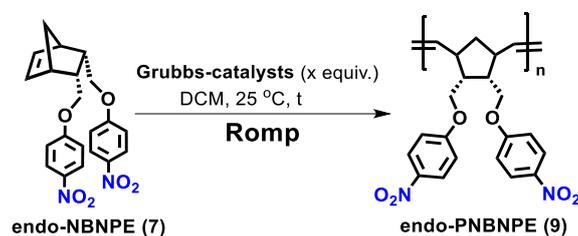

The solution of 4-nitrophenol (0.01 mmol or 0.02 mmol) and 4-aminophenol (0.01 mmol or 0.02 mmol) in deuterated water (2 mL) was prepared. The initial ratio of 4-NP and 4-AP (around 1/1) was detected by ¹H NMR before they were treated with Azo-POP-13 (10 mg) at room temperature for some time. Then the mixture was passed through 0.22 μm syring filter (ANPEL), and the filtrate was analyzed by ¹H-NMR (400 MHz). The Azo-POP-13 can be reused after removing the residues through washed with EtOH and water, activated by freeze drying.

3.2 The selective adsorption of 4-nitrophenol by using activated carbon

To compare with newly developed Azo-POP-13, the commercially available activated carbon ($S_{\text{BET}}=1450 \text{ m}^2/\text{g}$) was used for the selective adsorption. The procedure of adsorption on 4-nitrophenol was according to the above mentioned methods. The solution of 4-nitrophenol (0.01 mmol or 0.02 mmol) and 4-aminophenol (0.01 mmol or 0.02 mmol) in deuterated water (2 mL) was prepared. The initial ratio of 4-NP and 4-AP (around 1/1) was detected by ^1H NMR before they were treated with activated carbon (10 mg) at room temperature for some time. Then the mixture was passed through 0.22 μm syringe filter (ANPEL), and the filtrate was analyzed by ^1H -NMR (400 MHz).
