Scheme S1. Enantioselective reactions 1, 2, and 3 for catalytic asymmetric synthesis of chiral tetrasubstituted allenes from recemic propargylic alcohols, and possible activation mechanisms.

Sun group proposed the hydrogen bonding activation of quinone (denoted as stepwise-HB activation model in Scheme S1) for reactions 2 and 3 with -OH substituted substrate **Re1b/Re1c**. And the H^a shift from substrate **Re1b/Re1c** fragment to S=O group of catalyst and generate neutral complex to activate both of the reactants through the bifunctional model. Then we carefully check the Cartesian coordinate and geometry structure of the C-S bond formation **TS** located by Sun et al., and found that the H^a of the -OH group on the phenyl ring of substrate **Re1c** fragment is not transferred to the S=O group of the catalyst. Because the distance of O^a-H^a and O^b...H^a is 0.99 and 1.70 Å within van der Waals radius, indicating that H^a still connects with O^a and forms a hydrogen bonding with the S=O group of the catalyst. This is consistent with our calculation results that the realistic activation model is the cooperation HB and OH activation ion pair mechanism M-OH (M2-B model is revised to M-OH model) rather than the hydrogen bonding activation mechanism.

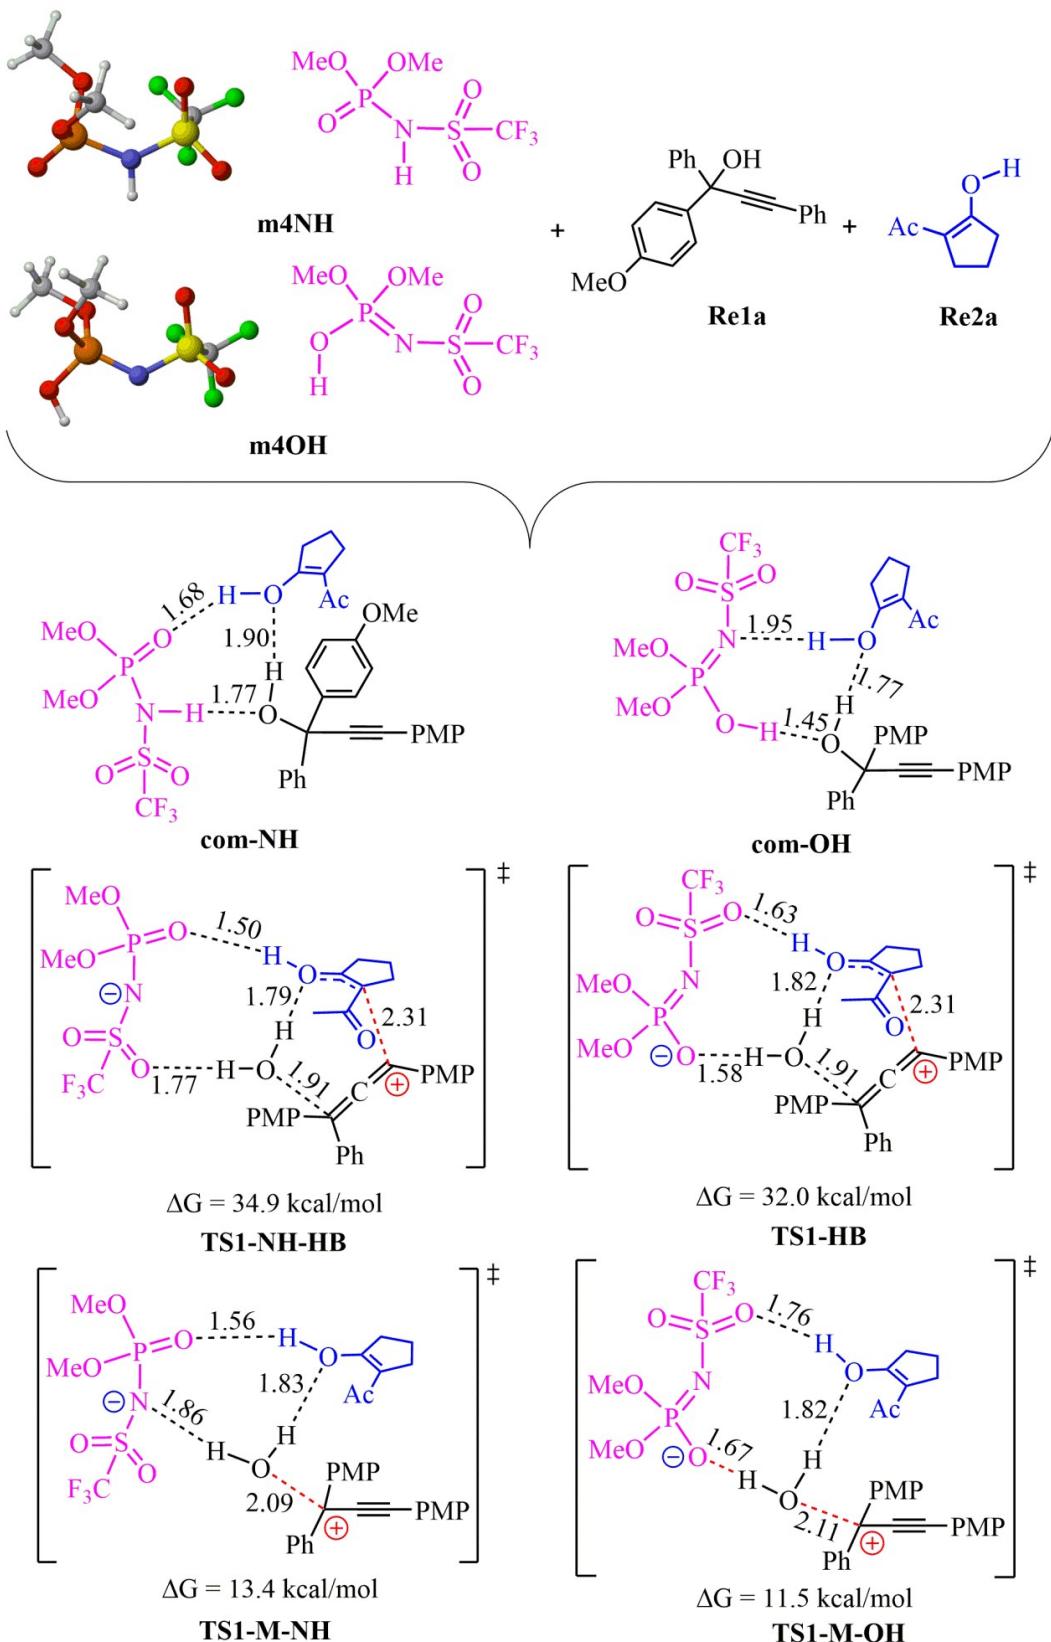

Figure S1. Optimized structures and Gibbs free energies of complexes and transition states for the reaction 1 of alcohol **Re1a**, 1,3-diketone **Re2a** catalyzed by **m4NH** or **m4OH**.

Conformational Analysis

For catalyst **4**, the orientation of the isopropyl group measured as H1-C2-C3-C4 dihedral angle as shown in Figure S1 can either be 0° or 180° , leading to a total of 4 possible conformations for each transition state. For the functional group of N-Triflylphosphoramides, additional conformational possibilities arising due to the dihedral angles differences along the P5-N6-S7-C8 (-180° , 90° , and 180°), which can result in more conformers **NH-I**, **NH-II**, and **NH-III** in NH tautomer and conformers **OH-I**, **OH-II**, and **OH-III** in OH tautomer. Thus, a total of 24 stereochemical possibilities for the catalyst are found for reactions 1 and 2. The energies of these conformations are provided in Table S1.

Scheme S2. Additional conformers for NH tautomer and OH tautomer.

The definition of the activation energy:

The activation energy (ΔE) is the sum of the distortion energy ($\Delta E_{\text{dist}}^{\ddagger} = \Delta E_{\text{dist}}(\text{cat}) + \Delta E_{\text{dist}}(\text{sub})$) and the interaction energy (ΔE_{int}) between the distorted substrates and the catalyst ($\Delta E = \Delta E_{\text{dist}}^{\ddagger} + \Delta E_{\text{int}}$) in the TS structures.
