**Figure S1.** Schematic illustration of preparation of palladium nanoparticles immobilized on nano silica triazine dendritic polymer (Pd<sub>np</sub>-nSTDP) catalyst.

## 1. Preparation of Pd<sub>np</sub>-nSTDP<sup>1</sup>

### Activation of Nano-Silica:

In a round-bottomed flask equipped with a condenser and a magnetic stirrer, a mixture of nano-silica (10 g, 40–100 nm) and concentrated HCl (80 mL, 6M) was heated in an oil-bath at 120 °C for 24 h. The mixture was filtered and the white powder was washed with distilled water until neutral pH. The solid was dried under vacuum at 120 °C.

### Preparation of Propylamine-Functionalized Nano-Silica (AP-nSiO<sub>2</sub>)

(AP-nSiO<sub>2</sub>): In a round-bottomed flask equipped with a condenser and a magnetic stirrer, a mixture of activated nanosilica (3 g) and 3-aminopropyltrimethoxysilane (APTS) (8 mL) in 50 mL of anhydrous toluene was stirred under reflux conditions for 8 h. The reaction mixture was filtered and the solid material was washed with toluene in a continuous extraction apparatus (Soxhlet) to remove the unreacted starting material, and dried in a vacuum oven at 110 °C.

### Preparation of CC1-nSiO<sub>2</sub>

The AP-nSiO<sub>2</sub> (2 g, 0.99 mmol g) 1 was added to a solution of cyanuric chloride (1.85 g, 10 mmol) and diisopropylethylamine (DIPEA) (10 mmol, 1.7 mL) in THF (10 mL). The reaction mixture was shaken overnight at room temperature. The solid material

was separated by filtration, washed with hot THF for 12 h in a Soxhlet apparatus to remove the unreacted starting materials and then dried in a vacuum oven at 50 °C.

### **Preparation of nano-silica-supported triazine dendritic polymer (G1)**

To a slurry of CC1-nSiO<sub>2</sub> (1 g) in DMF (12 mL) was added bis(3-aminopropyl)amine (8.11 mmol, 1 mL) and DIPEA (8.11 mmol, 1.4 mL). The reaction mixture was stirred at 80 °C for 16 h. The solid material was filtered, washed with hot ethanol for 12 h in a Soxhlet apparatus to remove the unreacted starting materials and then dried in a vacuum oven at 50 °C.

### **Preparation of CC2-nSiO<sub>2</sub>**

Nano-silica-supported triazine dendritic polymer, G1 (1 g, 0.45 mmol) was added to a solution of cyanuric chloride (1.66 g, 9 mmol) and DIPEA (9 mmol, 1.56 mL) in THF (20 mL). The reaction mixture was agitated at room temperature for 16 h. The reaction mixture was filtered and the solid was washed with hot THF for 16 h in a Soxhlet apparatus to remove the unreacted starting materials. Finally, the CC2-nSiO<sub>2</sub> was dried in a vacuum oven at 50 °C.

### **Preparation of nano-silica supported triazine dendritic polymer (G2 or nSTDP)**

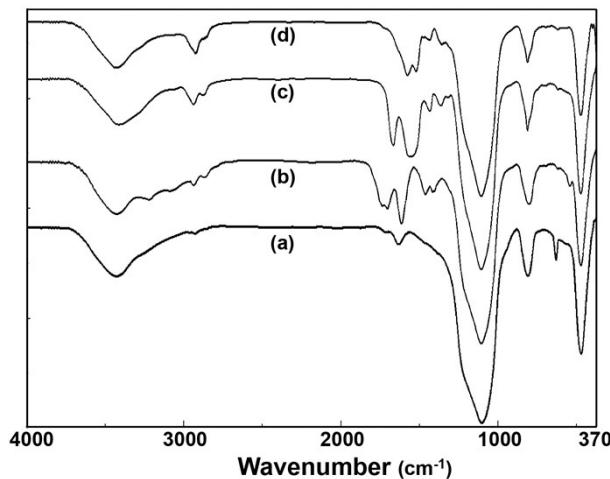

To a slurry of CC2-nSiO<sub>2</sub> (1 g, 0.36 mmol) in DMF (20 mL) was added bis(3-aminopropyl)amine (9.36 mmol, 1.14 mL) and DIPEA (9.36 mmol, 1.61 mL). The reaction mixture was agitated at 80 °C for 16 h and then filtered. The resulting nano-silica-supported dendritic polymer (G2 or nSTDP) was washed with hot ethanol for 24 h in a Soxhlet apparatus to remove unreacted starting materials and dried in a vacuum oven at 50 °C.

### **Preparation of nano-Silica triazine dendritic polymer supported palladium nanoparticles (Pd<sub>np</sub>-nSTDP)**

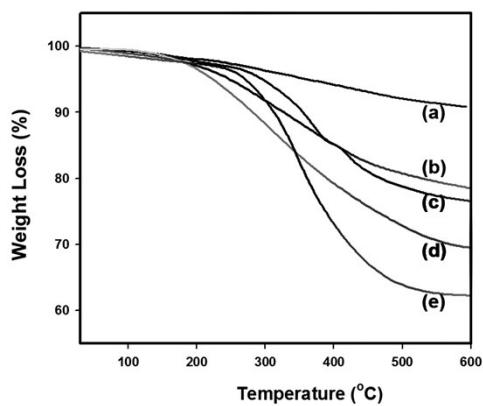

A mixture of PdCl<sub>2</sub> (240 mg, 1.36 mmol) and NaCl (88 mg, 1.52 mmol) in methanol (8 mL) was stirred at room temperature for 24 h and then filtered. The filtrates were diluted with methanol (40 mL) and nSTDP (1 g, 0.21 mmol) was added to this solution. The resulting mixture was stirred at 60 °C for 24 h. At the end of the reaction, the mixture was cooled to room temperature, sodium acetate (0.76 g, 9.28 mmol) was added and stirred at room temperature for 1 h. The solid was filtered, washed with methanol, water and acetone, to remove the unreacted starting materials

and then dried in vacuum to afford Pd<sub>np</sub>-nSTDP catalyst (1.07 g) as a light gray solid. Palladium analysis (ICP): 1.27%. Average particle diameter: 3.1±0.5 nm (based on TEM and particle size analyses).

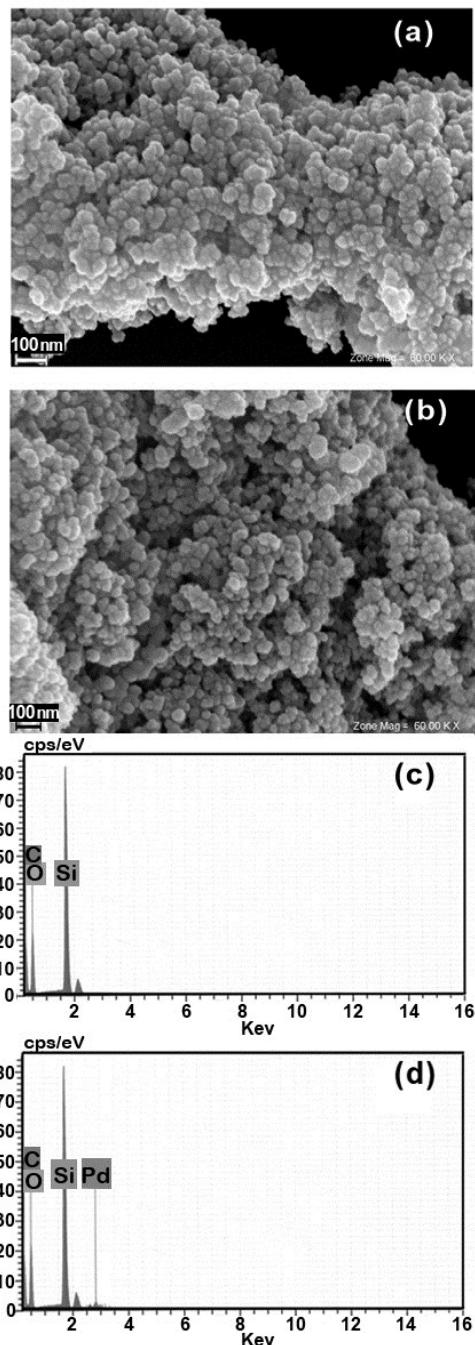

The Pd<sub>np</sub>-nSTDP catalyst was characterized by FT-IR spectroscopy, thermogravimetric analysis (TGA), field emission scanning electron microscopy (FE-SEM), energy dispersive X-ray (EDX), transmission electron microscopy (TEM) and elemental analysis.<sup>1</sup>
