S1. Compound Synthesis and Characterisation.

S1.1. General Experimental

Analytical thin layer chromatography (TLC) was performed with EM Science silica gel 60 F254 aluminium plates. Visualisation was carried out using a UV lamp (254 nm) and by immersion in potassium permanganate (KMnO_4), followed by heating using a heat gun. Organic solutions were concentrated by rotary evaporation at 40–45 °C. Purification of reaction products were generally done by flash column chromatography using Fluka Silica, pore size 60 Å, 220–440 mesh, 35–75 µm.

S1.2. Materials

Unless otherwise noted, all purchased materials were used without purification. All standard solvents were purchased from Sigma Aldrich. All standard acids, bases, and drying agents were purchased from Fisher Scientific. *N*-Hydroxy succinimide (NHS) and *N,N*-diisopropylethylamine (DIPEA) were purchased from Acros Organics. Cephalexin monohydrate and Boc_2O were purchased from Fluorochem. Pentynoic acid, *N,N*'-dicyclohexylcarbodiimide (DCC), lipoic acid, glutaric anhydride, oxalyl chloride, and Et_3N were purchased from Sigma Aldrich. DMAP was purchased from TCI.

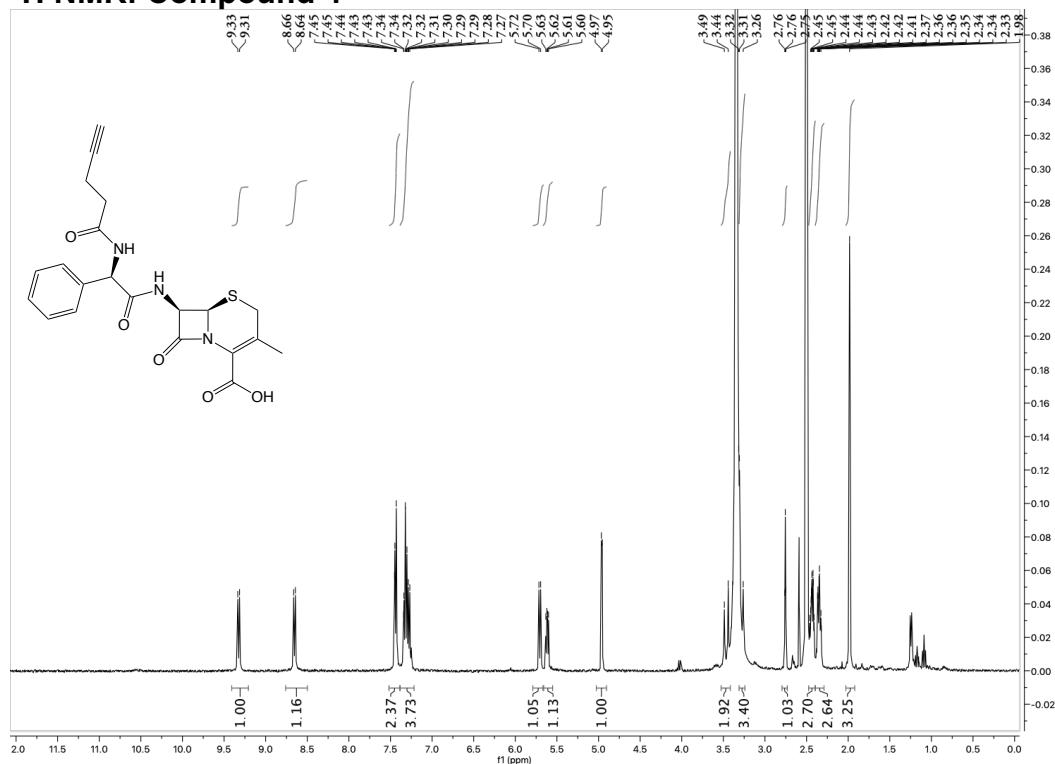

S1.3. Instrumentation

^1H and ^{13}C NMR spectra were recorded on a Jeol ECS 400 (400 MHz for ^1H , 101 MHz for ^{13}C) at ambient temperature. Chemical shifts are reported relative to residual solvent peaks and coupling constants (J) are given in Hertz. High-resolution ESI mass spectra were recorded on a Bruker microTOF electrospray mass spectrometer. Infrared (IR) spectra were recorded on a PerkinElmer Spectrum Two (ATIR). Analytical HPLC measurements were performed on a Shimadzu HPLC system (Prominence) equipped with a LC-20AD pump, SIL-20A autosampler, DGU-20AS degasser, CTO-20AC column oven, CBM-20A communication bus module and SPD-M20A diode array detector using a SunFire C18 column (Waters, 4.6 x 150 mm, 5 µm). Eluent gradient: 5–95% MeCN/H₂O with a 0.1% formic acid modifier, over 15 minutes.

S3.3. MBC₅₀ data

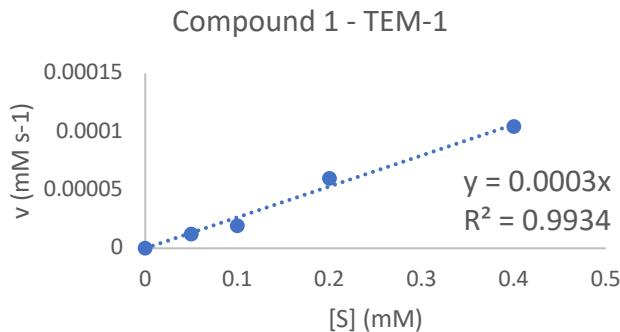

Protocol: After 16 h of incubation with compounds at 37 °C as per the MIC assay protocol, a 1 µL aliquot was taken from wells with no visible bacterial growth and transferred to the surface of the agar plate. Plates were incubated for a further 24 h at 37 °C. MBC₅₀ values were the lowest concentration of compound required to kill 50%, plates with no antibiotics were used as references for 100% growth. Experiments were performed in triplicate.
