## 2 Field Emission Scanning Electron Microscopy (FE-SEM):

**Supplementary Fig. 1** includes FE-SEM micrographs of the films M-S1, M-S2, N-S0, N-S1, and N-S3 processed by PATO. The cauliflower like morphology is seen for the M-S1 film and agglomerated sheet like morphology for M-S2 film. Here, N-S0 film shows irregular morphology with wide size distribution. Film N-S1 show grain growth with respect to N-S0 and the grains possesses small pores in it. N-S3 consists of mixed morphology in terms of size distribution as well as shapes.

Supplementary Figure 1. The Field emission - Scanning Electron Micrographs (FE-SEM) recorded after PATO processed for M-S1/S2 and N-S0/1/3 films kept at different processing condition with a 1 μm scale and magnification of x30000. (Every inset shows magnified micrograph of respective sample surface)
