**Suggested mechanism for the synthesis of napthoquinone derivatives using PCPs(Bi)N(CH<sub>2</sub>PO<sub>3</sub>H<sub>2</sub>)<sub>2</sub>**

A suggested mechanism for the synthesis of napthoquinone derivatives as salts of piperazine or piperidine **5a-5j** and **6a-6n** using PCPs(Bi)N(CH<sub>2</sub>PO<sub>3</sub>H<sub>2</sub>)<sub>2</sub> has been summarized in scheme 7. Initially, the aldehyde is activated by the acidic sites of the catalyst, in which 2-hydroxynaphthalene-1,4-dione reacts with the aldehyde, to afford intermediate (**I**). Then, intermediate (**I**) reacts with another 2-hydroxynaphthalene-1,4-dione by removing one water molecule and to afford intermediate (**II**). Intermediate (**II**), is converted to intermediate (**III**) via losing its proton. Piperazine receives (H<sup>+</sup>) from the catalyst and becomes a piperazinium cation at the intermediate (**IV**). Two intermediates (**III**) and (**IV**) come together. Finally, by repeating this process, the napthoquinone derivatives of piperazine are synthesized (Scheme S1).
