Experimental Part

**General.** All reactions were performed under a controlled dry nitrogen atmosphere using a high-vacuum line, standard Schlenk techniques, and an MBraun glovebox. The used glassware was dried in an oven at 130 °C and evacuated prior to use. The solvents THF, diethyl ether (Et₂O), benzene, toluene and n-pentane were dried by using an innovation technology SPS solvent system. Deuterated [D₂]dichloromethane (CD₂Cl₂) was dried by storing over molecular sieve (4 Å) for at least one day before degassing by three freeze-pump-thaw cycles. Standard chemicals were obtained from commercial suppliers and used as delivered if not mentioned otherwise. N-Heterocyclic carbenes were synthesized according to literature procedures. S1

**NMR spectroscopy.** NMR spectra were recorded on Bruker Avance DPX-400 spectrometers. ¹H NMR spectra were calibrated against the residual proton signal of the solvent as internal reference ([D₂]dichloromethane: δ ¹H(CDHCl₂) = 5.32) and ¹³C{¹H} NMR spectra by using the central line of the solvent signal ([D₂]dichloromethane: δ ¹³C(CDHCl₂) = 53.8).

**Mass spectrometry.** High resolution mass spectra were recorded on an LTQ Orbitrap ELITE ETD with a nanoESI source, or a Xevo G2-S QTOF with an ESI source.

**UV-vis spectroscopy.** Data were recorded on a Cary 60 Spectrometer (Agilent Technologies).

**EPR Spectroscopy.** The EPR measurements were performed at room temperature using a Bruker EleXsys E500 X-band EPR spectrometer, which was equipped with a high-Q cylindrical cavity, Model ER 4122 SHQE (from Bruker BioSpin GmbH, Karlsruhe, Germany).
Reaction of IDipp with [Ph3C][B(C6F5)4] at –40 °C:

A toluene solution (2 mL) of IDipp (1a) (100 mg, 0.257 mmol) was added slowly to a stirred toluene solution (2 mL) of [Ph3C][B(C6F5)4] (238 mg, 0.257 mmol) at –40 °C. The color of solution changed from orange to purple, and then to yellow. The resulting suspension was stirred for another 10 min. After that, the solvent was removed under vacuum, and the residue was washed three-times with n-pentane (3 x 4 mL). The resulting yellow solid was dried under vacuum (Yield: 330 mg, 98%). Light-yellow crystals of salt 2a, suitable for XRD analysis, were obtained from DCM / n-pentane (1:3) at –40 °C.

1H NMR (400 MHz, 298 K, [D2]dichloromethane): \( \delta = 1.24 \) (d, \( ^3J(1H-1H) = 6.8 \) Hz, 12H, CH(CH3)2), \( ^3J(1H-1H) = 6.8 \) Hz, 12H, CH(CH3)2), 2.35 (sept., \( ^3J(1H-1H) = 6.8 \) Hz, 4H, CH(CH3)2), 4.76 (m, 1H, IDippCH), 5.35 (d of d, \( ^3J(1H-1H) = 4.0 \) Hz, 9.7 Hz, 2H, CH=CH), 6.40 (d of d, \( ^3J(1H-1H) = 2.0 \) Hz, 9.7 Hz, 2H, CH=CH), 6.89 (m, 4H, o-CPh2), 7.31 (m, 6H, m, p-CPh2), 7.47 (s, 2H, N-CH=CH), 7.50 (d, \( ^3J(1H-1H) = 7.9 \) Hz, 4H, m-Dipp), 7.73 (t, \( ^3J(1H-1H) = 7.9 \) Hz, 2H, p-Dipp).

13C{1H} NMR (101 MHz, 298 K, [D2]dichloromethane): \( \delta = 22.3, 26.1 \) (CH(CH3)2), 30.1 (CH(CH3)2), 36.8 (IDippCH), 118.6 (CH=CH), 124.3 (C=CPh2), 125.6 (m-Dipp), 125.7 (N-CH=CH), 128.4 (m-CPh2), 128.5 (p-CPh2), 129.5 (ipso-Dipp), 130.4 (o-CPh2), 131.7 (CH=CH), 133.3 (p-Dipp), 136.8 (dm, \( ^1J(13C-19F) = 245 \) Hz, m-C=C=C,F3), 138.7 (dm, \( ^1J(13C-19F) = 245 \) Hz, p-C=C=C,F3), 140.5 (ipso-CPh2), 145.1 (C=CPh2), 145.7 (o-Dipp), 147.2 (NCN), 148.6 (dm, \( ^1J(13C-19F) = 242 \) Hz, o-C=C=C,F3).

11B{1H} NMR (128 MHz, 298 K, [D2]dichloromethane): \( \delta = -16.6 \) (B(C6F5)4).

19F{1H} NMR (377 MHz, 298 K, [D2]dichloromethane): \( \delta = -132.9 \) (dm, m-CF2), -163.5 (t, p-CF2, \( ^3J(19F-19F) = 21 \) Hz), -167.4 (t, m-CF2, \( ^3J(19F-19F) = 18 \) Hz).

HRMS (APPI/QTOF) m/z: [M]+ Calcd for C46H51N2+ 631.4047; Found 631.4040.

HRMS (APPI/QTOF) m/z: [M]+ Calcd for C24BF20- 678.9779; Found 678.9778.

Reaction of IDipp with \([\text{Ph}_3\text{C}][\text{B(C}_6\text{F}_5)_4]\) at room temperature:

\[
\text{Dipp} \quad + \quad [\text{Ph}_3\text{C}][\text{X}]
\]

\[
\begin{align*}
1a & \quad \text{toluene} \quad \text{r.t.} \\
& \quad \text{Dipp} \quad \text{H}^- \\
& \quad \text{Ph} \\
& \quad \text{Dipp} \quad \text{X}^- \\
2a & \quad 76\% \\
3a & \quad 24\% \\
\text{Ph}_3\text{CH} & \quad 5\%
\end{align*}
\]

X = \([\text{B(C}_6\text{F}_5)_4]\)

Scheme S2.

A toluene solution (2 mL) of IDipp (1a) (100 mg, 0.257 mmol) was added to a stirred toluene solution (2 mL) of \([\text{Ph}_3\text{C}][\text{B(C}_6\text{F}_5)_4]\) (238 mg, 0.257 mmol) at room temperature. The color of solution changed from orange to purple, and then to brown (see the picture in Scheme S2). The resulting reaction mixture was stirred for another 1 h. After that, the solvent was removed under vacuum, and the light-yellow solid was used for NMR spectroscopy without purification. \(^1\text{H}\) NMR spectroscopy indicated that the formation of adduct 2a and 3a in a ratio of 1 : 3.2 along with trace of \(\text{Ph}_3\text{CH}\) (see Figure S2a).

**Figure S2a.** \(^1\text{H}\) NMR (400 MHz, 298 K, \([\text{D}_2]\text{dichloromethane}\)) spectrum of the products formed by reaction of IDipp with \([\text{Ph}_3\text{C}][\text{B(C}_6\text{F}_5)_4]\) in toluene at room temperature.
Figure S2b. Stacked $^1$H NMR (400 MHz, 298 K, [D$_2$]dichloromethane) spectra of the reaction mixture, of adduct 2a, of the imidazolium salt 3a, of carbene 1a, and of triphenyl methane (from the top to the bottom).

Figure S3. ESI-MS spectrum of the products formed by reaction of IDipp with [Ph$_3$C][B(C$_6$F$_5$)$_4$] in toluene at room temperature.
Figure S4. MS spectrum from a GC analysis of the products formed by reaction of IDipp with [Ph₃C][B(C₆F₅)₄] in toluene at room temperature (top), and NIST Mass Spectrometry Data Center spectrum of Ph₃CH (bottom).
Figure S5. Color of a solution of [Ph$_3$C][B(C$_6$F$_5$)$_4$] in chlorobenzene upon dropwise addition of a chlorobenzene solution of IDipp ($2 \times 10^{-4}$ M).

Figure S6. Black: Experimental EPR spectrum of the trityl radical in chlorobenzene ($T = 298$ K). The spectrum was recorded using the solution obtained after reaction of [Ph$_3$C][B(C$_6$F$_5$)$_4$] with IDipp in toluene at room temperature. Red: Simulated EPR spectrum of the trityl radical using the following parameters from the literature$^{82}$: $g = 2.0025$, $A(o\text{-H}) = 2.6$ G, $A(m\text{-H}) = 1.1$ G, $A(p\text{-H}) = 2.8$ G.)
**Figure S7.** Evolution of the UV-vis spectra of a chlorobenzene solution containing 1a and [Ph₃C][B(C₆F₅)₄] (2 x 10⁻⁴ M). The spectra were collected during 5 min.

**Figure S8.** Evolution of the UV-vis spectra of the reaction mixture of 1a with [Ph₃C][B(C₆F₅)₄] in chlorobenzene after being exposed to air (2 x 10⁻⁴ M).

**Figure S9.** UV-vis spectrum of adduct 2a in chlorobenzene (10⁻⁴ M).
**Figure S10.** UV-vis spectrum of salt [Ph₃C][B(C₆F₅)₄] in chlorobenzene (10⁻⁴ M).

**Figure S11.** Evolution of the UV-vis spectra of a chlorobenzene solution containing 1a and [Ph₃C][BF₄]. The spectra were collected during 1 min.

**Figure S12.** UV-vis spectrum of salt [Ph₃C][BF₄] in chlorobenzene.
One-electron oxidation of IDipp by [NO][SbF$_6$]:

\[
\begin{align*}
\text{Dipp} & \quad + \quad \text{[NO][SbF$_6$]} \quad \xrightarrow{\text{PhCl/r.t.}} \quad \text{Dipp}^+ \quad \xrightarrow{\text{decay}} \quad \text{Dipp}^+ - \text{SbF}_6
\end{align*}
\]

Scheme S3.

[NO][SbF$_6$] (6.8 mg, 0.026 mmol) was added to a chlorobenzene solution (3 ml) of IDipp (1a) (10 mg, 0.026 mmol) at room temperature. Immediately after the addition, the solution turned purple, suggesting the formation of [1a]$^+$ and nitric oxide (NO), while it became progressively yellowish over time. Kinetic analysis (Figure S13) of a freshly prepared reaction mixture revealed a first order decay ($k_{\text{obs}} = 0.002$ s$^{-1}$) of an absorption band centred at 560 nm, which we ascribe to [1a]$^+$. The continuous absorption throughout almost the entire visible region observed at the end is in line with the presence of NO (see reference S3).

Figure S13. a) Evolution of the UV-vis spectra of 1a in PhCl immediately after the addition of [NO][SbF$_6$] (the time between the collection of each spectrum is 20 seconds). b) Absorbance at 560 nm over time. The dotted line represents the best fit to the first order kinetic model.

N.B.: UV-vis measurements of mixtures of 1a and [Ph$_3$C][B(C$_6$F$_5$)$_4$], [Ph$_3$C][BF$_4$], or [NO][SbF$_6$] show that the counter anion influences the UV-vis absorption of the radical cation [1a]$^+$ ($\lambda = 591$ nm with B(C$_6$F$_5$)$_4$, $\lambda = 556$ nm with BF$_4$, $\lambda = 560$ with SbF$_6$). This influence is probably due to week interactions between the radical cation [1a]$^+$ and the respective anion.
Reaction of IDipp with [NO][SbF$_6$] in toluene:

\[
\begin{align*}
\text{Dipp} & \quad + \quad [\text{NO}][\text{SbF}_6] \\
\xrightarrow{\text{toluene}, \text{r.t.}} & \quad \text{Dipp}^+ \quad \text{SbF}_6^- \\
\text{IDipp (1a)} & \quad \xrightarrow{} \quad \text{5}
\end{align*}
\]

Scheme S4.

Toluene (3 mL) was added to a mixture of IDipp (1a) (50 mg, 0.129 mmol) and [NO][SbF$_6$] (34 mg, 0.129 mmol) at room temperature. The color of solution changed to purple, and then to pale-yellow. The resulting suspension was stirred for overnight. After that, the solvent was removed under vacuum, and the residue was used for NMR spectroscopy without purification. $^1$H NMR spectroscopy indicated that the formation of the imidazolium salt 5 as main product (see Figure S14).

$^1$H NMR (400 MHz, 298 K, $[\text{D}_2]$dichloromethane): $\delta = 1.22$ (d, $^3$J($^1$H-$^1$H) = 6.8 Hz, 12H, CH(CH$_3$)$_2$), 1.30 (d, $^3$J($^1$H-$^1$H) = 6.8 Hz, 12H, CH(CH$_3$)$_2$), 2.40 (sept., $^3$J($^1$H-$^1$H) = 6.8 Hz, 4H, CH(CH$_3$)$_2$), 7.43 (d, $^3$J($^1$H-$^1$H) = 7.9 Hz, 4H, m-Dipp), 7.65 (t, $^3$J($^1$H-$^1$H) = 7.9 Hz, 2H, p-Dipp), 7.70 (s, 2H, CH=CH), 8.44 (s, 1H, N-CH-N).

Figure S14. $^1$H NMR (400 MHz, 298 K, $[\text{D}_2]$dichloromethane) spectrum of the products obtained by reaction of IDipp (1a) with [NO][SbF$_6$] in toluene at room temperature (#: unknown side products).
Reactions of [IDipp] with [CPh₃][B(C₆F₅)₄] in the presence of THF:

Scheme S5.

A toluene/THF (1:1) solution (2 mL) of IDipp (1a) (50 mg, 0.129 mmol) was added slowly to a stirred toluene solution (2 mL) of [Ph₃C][B(C₆F₅)₄] (119 mg, 0.129 mmol) at room temperature. The color of solution changed from orange to purple, and then to brown. The resulting reaction mixture was stirred for overnight. After that, the solvent was removed under vacuum, and the residue was used for NMR spectroscopy without purification. The results of the NMR spectroscopic analysis indicated the formation of mixture of 2a (a peak at 4.76 ppm, see Figures S15a), 3a (a peak at 8.31 ppm) and Ph₃CH (a peak at 5.57 ppm). The ratio of adduct 2a, 3a and Ph₃CH is 0.37 : 1 : 1 (see Figure S15a).

Figure S15a. ¹H NMR (400 MHz, 298 K, [D₂]dichloromethane) spectrum of the products of the reaction between IDipp and [Ph₃C][B(C₆F₅)₄] in the presence of THF.
Reaction of IDipp with [CPh3][B(C6F5)4] in the presence of triphenyltin hydride:

\[
\text{Ph3SnH} (45 \text{ mg, 0.128 mmol}) \text{ was added to the mixture of [Ph3C][B(C6F5)4]} (59.5 \text{ mg, 0.064 mmol) and IDipp (1a) (25 mg, 0.064 mmol) at room temperature. The color of solution changed from orange to purple, and then to light-yellow. The reaction mixture was stirred for another 30 min. The solvent was removed under vacuum, and the residue was analysed by NMR spectroscopy. The NMR spectra indicated the formation of a mixture of 2a (a peak at 4.76 ppm, see Figures S16a), 3a (a peak at 8.31 ppm) and Ph3CH (a peak at 5.57 ppm), along with the by-product Ph3SnSnPh3 (a peak at 131.1 ppm in the }^{119}\text{Sn NMR spectrum, see Figure S16b). The yield of the imidazolium salt 3a is 42\% (yield of 3a was determined by using ClCH2CH2Cl (0.063 mmol) as internal standard, see Figure S16a).

NMR data of Ph3SnSnPh3:
\[\text{^{1}H NMR (400 MHz, 298 K, [D\textsubscript{2}]dichloromethane): } \delta = 7.42 \text{ (m, 12H, Ph3SnSnPh3), 7.61 (m, 18H, Ph3SnSnPh3).}\]
\[\text{^{119}Sn NMR (149.1 MHz, 298 K, [D\textsubscript{2}]dichloromethane): } \delta = 131.1 \text{ (s, Ph3SnSnPh3).}\]

NMR data of Ph3CH:
\[\text{^{1}H NMR (400 MHz, 298 K, [D\textsubscript{2}]dichloromethane): } \delta = 5.57 \text{ (s, 12H, Ph3CH), 7.15 (m, 6H, o-Ph3CH), 7.23 (m, 3H, p-Ph3CH), 7.31 (m, 6H, m-Ph3CH).}\]
Figure S16a. $^1$H NMR (400 MHz, 298 K, [D$_2$]dichloromethane) spectrum of the products of the reaction between IDipp and [Ph$_3$C][B(C$_6$F$_5$)$_4$] in the presence of Ph$_3$SnH ($\#$: unknown side product. ClCH$_2$CH$_2$Cl (0.063 mmol) was added to the CD$_2$Cl$_2$ solution as internal standard).

Figure S16b. $^{119}$Sn NMR (149 MHz, 298 K, [D$_2$]dichloromethane) spectrum of the products of the reaction between IDipp and [Ph$_3$C][B(C$_6$F$_5$)$_4$] in the presence of Ph$_3$SnH.
Figure S16c. $^1$H NMR (400 MHz, 298 K, [D$_2$]dichloromethane) spectrum of triphenylmethane (isolated from the reaction mixture by extraction with $n$-pentane).
Synthesis of imidazolium salt 3a:

Dichloromethane (2 ml) was added to a mixture of 1,3-bis(2,6-diisopropylphenyl)imidazolium chloride (50 mg, 0.120 mmol) and potassium tetrakis(pentafluorophenyl)borate (85 mg, 0.120 mmol) at room temperature. The reaction mixture was stirred for overnight. The resulting mixture was filtered by using a PTFE syringe filter to remove KCl. The solvent of the filtrate was removed under reduced pressure, and the remaining colorless solid was used for NMR spectroscopy without purification. On the basis of the analysis of the NMR spectra, the yield of imidazolium salt 3a is almost quantitative. Colorless crystals of salt 3a, suitable for XRD analysis, were obtained from DCM at room temperature.

$^{1}H$ NMR (400 MHz, 298 K, [D$_2$]dichloromethane): $\delta = 1.22$ (d, $^3J(1H-1H) = 6.8$ Hz, 12H, CH(CH$_3$)$_2$), 1.30 (d, $^3J(1H-1H) = 6.8$ Hz, 12H, CH(CH$_3$)$_2$), 2.37 (sept., $^3J(1H-1H) = 6.8$ Hz, 4H, CH(CH$_3$)$_2$), 7.45 (d, $^3J(1H-1H) = 7.9$ Hz, 4H, m-Dipp), 7.62 (s, 2H, CH=CH), 7.67 (t, $^3J(1H-1H) = 7.9$ Hz, 2H, p-Dipp), 8.31 (s, 1H, N-CH=N).

$^{13}C$NMR (101 MHz, 298 K, [D$_2$]dichloromethane): $\delta = 23.8, 24.6$ (CH(CH$_3$)$_2$), 29.7 (CH(CH$_3$)$_2$), 125.6 (m-Dipp), 126.3 (CH=CH), 129.4 (ipso-Dipp), 129.4 (p-Dipp), 136.7 (dm, $^1J(^{13}C-^{19}F) = 246$ Hz, m-C-C$_6$F$_5$), 136.9 (NCN), 138.6 (dm, $^1J(^{13}C-^{19}F) = 244$ Hz, p-C-C$_6$F$_5$), 145.3 (o-Dipp), 148.4 (dm, $^1J(^{13}C-^{19}F) = 244$ Hz, o-C-C$_6$F$_5$).

$^{11}B$NMR (128 MHz, 298 K, [D$_2$]dichloromethane): $\delta = -16.6$ (B(C$_6$F$_5$)$_4$).

$^{19}F$NMR (377 MHz, 298 K, [D$_2$]dichloromethane): $\delta = -133.0$ (dm, o-CE$_2$), $-163.7$ (t, p-CE$_2$, $^3J(^{19}F-^{19}F) = 21$ Hz), $-167.6$ (t, m-CE$_2$, $^3J(^{19}F-^{19}F) = 18$ Hz).

Scheme S10.

A toluene (2 mL) solution of Ph\textsubscript{3}SnH (195 mg, 0.556 mmol) was added to a mixture of [Ph\textsubscript{3}C][B(C\textsubscript{6}F\textsubscript{5})\textsubscript{4}] (256 mg, 0.278 mmol) and I\textsubscript{Bu} (1b) (50 mg, 0.278 mmol) at room temperature. The color of solution changed from orange to purple and then to light-yellow. The reaction mixture was stirred for another 30 min. The resulting solution separated as three layers. The upper two phases and the lower oily phase were allowed to separate. The solvent of upper two phases was removed under vacuum, and the results of an NMR spectroscopic analysis indicated the formation of Ph\textsubscript{3}SnSnPh\textsubscript{3} (a peak at 131.1 ppm in \textsuperscript{119}Sn NMR spectrum, see Figure S20g) and Ph\textsubscript{3}CH (a peak at 5.57 ppm, see Figure S20f). The separated lower colourless solid was identified as the imidazolium salt 3b (a peak at 8.16 ppm, see Figure S20a), which was formed in 87% yield (yield of 3b was determined by using ClCH\textsubscript{2}CH\textsubscript{2}Cl (0.063 mmol) as internal standard, see Figure S20a).

NMR data of 3b:

\textsuperscript{1}H NMR (400 MHz, 298 K, [D\textsubscript{2}]dichloromethane): δ = 1.65 (s, 18H, tBu), 7.44 (s, 2H, CH=CH), 8.16 (s, 1H, N-CH-N).

\textsuperscript{13}C{\{}\textsuperscript{1}H\}\} NMR (101 MHz, 298 K, [D\textsubscript{2}]dichloromethane): δ = 29.7 (tBu), 61.5 (tBu), 121.0 (CH=CH), 129.4 (N-CH-N), 124.8 (br, ipso-C-C\textsubscript{6}F\textsubscript{5}), 136.7 (dm, \textsuperscript{1}J(\textsuperscript{13}C-\textsuperscript{19}F) = 246 Hz, m-C-C\textsubscript{6}F\textsubscript{5}), 138.7 (dm, \textsuperscript{1}J(\textsuperscript{13}C-\textsuperscript{19}F) = 244 Hz, p-C-C\textsubscript{6}F\textsubscript{5}), 148.6 (dm, \textsuperscript{1}J(\textsuperscript{13}C-\textsuperscript{19}F) = 242 Hz, o-C-C\textsubscript{6}F\textsubscript{5}).

\textsuperscript{11}B{\{}\textsuperscript{1}H\}\} NMR (128 MHz, 298 K, [D\textsubscript{2}]dichloromethane): δ = −16.6 (B(C\textsubscript{6}F\textsubscript{5})\textsubscript{4}).

\textsuperscript{19}F{\{}\textsuperscript{1}H\}\} NMR (377 MHz, 298 K, [D\textsubscript{2}]dichloromethane): δ = −133.0 (dm, o-CE), −163.7 (t, p-CE, \textsuperscript{3}J(F-F) = 21 Hz), −167.6 (t, m-CE, \textsuperscript{3}J(F-F) = 18 Hz).

HRMS (ESI/QTOF) m/z: [M]\textsuperscript{+} Calcd for C\textsubscript{11}H\textsubscript{21}N\textsubscript{2}\textsuperscript{+} 181.1699; Found 181.1699.

Reaction of IMes with [Ph₃C][B(C₆F₅)₄] at −40 °C:

![Scheme S11](image)

A toluene solution (2 mL) of IMes 1c (50 mg, 0.164 mmol) was added slowly to a stirred toluene solution (2 mL) of [Ph₃C][B(C₆F₅)₄] (152 mg, 0.164 mmol) at −40 °C. The color of solution changed from orange to purple, and then to yellow. After that, the solvent was removed under vacuum, and the residue was used for NMR spectroscopy without purification. ¹H NMR spectroscopy indicated that the formation of 2c, 3c and 4 in a ratio of 1.74 : 1 : 27.12 (see Figure S21a). Adduct 4 was isolated by crystallization from DCM/n-hexane (1:1) (Yield: 20 mg, 10%).

NMR data of 4:

¹H NMR (400 MHz, 298 K, [D₂]dichloromethane): δ = 1.94 (s, 12H, o-Me-Mes), 2.16 (s, 6H, p-Me-Mes), 6.58 (s, 4H, m-Mes), 7.00 (m, 12H, CPh₃), 7.15 (m, 3H, CPh₃), 7.35 (s, 2H, CH=CH).

¹³C{¹H} NMR (101 MHz, 298 K, [D₂]dichloromethane): δ = 20.0 (o-Me-Mes), 20.7 (p-Me-Mes), 64.5 (CPh₃), 127.3 (CH=CH), 127.6, 128.6, 131.8, 138.8 (CPh₃), 130.6, 133.7, 135.0, 141.3 (Mes), 136.7 (dm, ¹J(¹³C-¹⁹F) = 244 Hz, m-CH=C₆F₅), 138.7 (dm, ¹J(¹³C-¹⁹F) = 244 Hz, p-CH=C₆F₅), 148.5 (dm, ¹J(¹³C-¹⁹F) = 244 Hz, o-CH=C₆F₅), 150.8 (N-C-N).

¹¹B{¹H} NMR (128 MHz, 298 K, [D₂]dichloromethane): δ = −16.6 ([B(C₆F₅)₄]).

¹⁹F{¹H} NMR (377 MHz, 298.0 K, [D₂]dichloromethane): δ = −133.1 (dm, o-CF), −163.7 (t, p-CF, ³J(¹⁹F-¹⁹F) = 21 Hz), −167.5 (t, m-CF, ³J(¹⁹F-¹⁹F) = 18 Hz).

HRMS (ESI/QTOF) m/z: [M]+ Calcd for C₄₀H₃₉N₂⁺ 547.3108; Found 547.3110.

HRMS (ESI/QTOF) m/z: [M]⁻ Calcd for C₂₃BF²⁺ 678.9779; Found 678.9974.

Reaction of IMes with [CPh3][B(C6F5)4] in the presence of THF:

Scheme S12.

A toluene/THF (1:1) solution (2 mL) of IMes (1c) (25 mg, 0.082 mmol) was added slowly to a stirred toluene solution (2 mL) of [Ph3C][B(C6F5)4] (76 mg, 0.082 mmol) at room temperature. The color of solution changed from orange to purple, and then to light-yellow. The resulting reaction mixture was stirred for overnight. After that, the solvent was removed under vacuum, and the residue was used for NMR spectroscopy without purification. 1H NMR spectroscopy indicated the formation of 3c and Ph3CH in a yield of 63% (see Figure S22a). After washing with n-pentane, the remaining colorless solid was identified as pure 3c (see Figure S22b).

NMR data of 3c:

1H NMR (400 MHz, 298 K, [D2]dichloromethane): δ = 2.12 (s, 12H, o-Me-Mes), 2.38 (s, 6H, p-Me-Mes), 7.13 (s, m-Mes), 7.55 (s, 2H, CH=CH), 8.26 (s, 1H, N-CH-N).

13C{1H} NMR (101 MHz, 298 K, [D2]dichloromethane): δ = 17.3 (o-Me-Mes), 21.2 (p-Me-Mes), 123.6 (br, ipso-C-C6F5), 125.6 (CH=CH), 130.2 (p-Mes), 130.6 (m-Mes), 134.3 (ipso-Mes), 136.0 (N-C-N), 136.7 (dm, 1J(13C-19F) = 244 Hz, m-C-C6F5), 138.7 (dm, 1J(13C-19F) = 244 Hz, p-C-C6F5), 143.1 (o-Mes), 148.5 (dm, 1J(13C-19F) = 242 Hz, o-C-C6F5).

11B{1H} NMR (128 MHz, 298 K, [D2]dichloromethane): δ = −16.6 (B(C6F5)4).

19F{1H} NMR (377 MHz, 298 K, [D2]dichloromethane): δ = −132.9 (dm, o-CEF), −163.5 (t, p-CEF, 3J(19F-19F) = 21 Hz), −167.4 (t, m-CEF, 3J(19F-19F) = 18 Hz).

Crystallographic Analyses

Bragg-intensities of 2a, 3a, 3b and 4 were collected at 140 K using Cu Kα radiation. A Rigaku SuperNova dual system diffractometer with an Atlas S2 CCD detector was used for compounds 2a, 3a and 4, and one equipped with an Atlas CCD detector for compound 3b. The datasets were reduced and corrected for absorption, with the help of a set of faces enclosing the crystals as snugly as possible, with the latest available version of CrysAlis Pro. The solutions and refinements of the structures were performed by the latest available version of ShelXT and ShelXL. All non-hydrogen atoms were refined anisotropically using full-matrix least-squares based on |F|^2. The hydrogen atoms were placed at calculated positions by means of the “riding” model in which each H-atom was assigned a fixed isotropic displacement parameter with a value equal to 1.2 Ueq of its parent C-atom (1.5 Ueq for the methyl groups). Crystallographic and refinement data are summarized in Table S1. Crystallographic data have been deposited with the Cambridge Crystallographic Data Centre and correspond to the following codes: 2a (1980460), 3a (1980461), 3b (1980595) and 4 (1980462). These data can be obtained free of charge via www.ccdc.cam.ac.uk/data_request/cif, or by emailing data_request@ccdc.cam.ac.uk, or by contacting The Cambridge Crystallographic Data Centre, 12 Union Road, Cambridge CB2 1EZ, UK; fax: +44 1223 336033.

In the structure 3a, one of C₆F₅ rings is disordered over two orientations each, found in a difference map. These were anisotropically refined imposing distance and similarity restraints (SADI, AFIX; FLAT and SIMU) for the least-squares refinement, yielding site occupancies of 0.679(7)/0.321(7).
Table S1. Crystal data and structure refinement for 2a, 3a, 3b and 4.
