1. General Materials and Methods

1.1. Chemistry

Unless stated otherwise, reagents and solvents were sourced from commercial suppliers, specifically: Acros Organics, Fisher Scientific, Fluka Chemie GmbH, Fluorochem, Sigma Aldrich and TCI and were used directly as received. Reactions requiring inert conditions were performed using dry solvents and under an atmosphere of nitrogen. Solvents were dried using an Innovative Technology Inc. PS-400-7 Solvent Purification System.

TLC was carried out on commercially available pre-coated aluminium-backed silica plates and compounds were visualised under UV light at 254 nm. Column chromatography was performed using 60 micron silica purchased from Sigma Aldrich.

$^1$H NMR and $^{13}$C NMR spectra were recorded either in deuterated chloroform, acetone, methanol or DMSO at ambient temperature on either a Bruker Avance 250 (250 MHz), Bruker Avance 300 (300 MHz) or Bruker Avance 500 (500 MHz), with proton decoupling for all $^{13}$C NMR spectra. Chemical shifts ($\delta$ / ppm) are referenced against tetramethylsilane as an internal standard and the abbreviations: s, d, t, q, quin, sext, m, and br, were used to denote singlet, doublet, triplet, quartet, quintet, sextet, multiplet, and broad respectively. Coupling constants ($J$ / Hz) are reported where known.

Initially, analysis by mass spectrometry was conducted either by the EPSRC UK national mass spectrometry facility at Swansea University medical school on an electrospray ionisation LTQ Orbitrap XL 1 (Thermo Fisher Scientific) or on a microTOF electrospray time of flight (ESI-TOF) mass spectrometer (Bruker Dlatonik GmbH, Germany) at the University of Bath. More recently, LC-MS analyses were performed using an Agilent QTOF 6545 with Jetstream ESI spray source coupled to an Agilent 1260 Infinity II Quat pump HPLC with 1260 autosampler, column oven compartment and variable wavelength detector (VWD). The MS was operated in either positive or negative ionisation mode with the gas temperature at 250 °C, the drying gas at 12 L/min and the nebuliser gas at 45 psi (3.10 bar). The sheath gas temperature and flow were set to 350 °C and 12 L/min, respectively. The MS was calibrated using reference calibrant introduced from the independent ESI reference sprayer. The VCap, Fragmentor and Skimmer were set to 3500, 125 and 45 respectively.

For more advanced mass spectrometry analysis, the following guidelines were followed: Flow infusion analysis was conducted using a Maxis HD quadrupole electrospray time-of-flight (ESI-QTOF) mass spectrometer (Bruker Daltionik GmbH, Bremen, Germany) in negative-ion mode. The capillary voltage was set to 4500 V, nebulising gas at 1 bar, drying gas at 4 L/min. The drying gas temperature was increased from 200 – 280 °C during the first infusion. For the second infusion the freshly prepared sample was run at 280 °C, then increased to 320 °C. Extracted MS spectra represents drying gas conditions of 280 °C. The TOF scan range was from 50 – 1000 mass-to-charge ratio (m/z). Infusion injections were performed by the infusion pump using a flow rate of 3 µL/min. The MS instrument was calibrated using a sodium formate calibrant solution. The calibrant solution consisted of 3 parts of 1 M NaOH to 97 parts of 50 : 50 water : isopropanol with 2 % formic acid. Data processing was performed using the Compass Data Analysis software version 4.3 (Bruker Daltionik GmbH, Bremen, Germany).

Fourier Transform Infrared (FTIR) spectra were recorded on an ATR Perkin–Elmer FTIR Spectrum 100
spectrometer. The spectra were measured between 4000 – 600 cm$^{-1}$. Selected absorption bands are reported in wavenumbers (cm$^{-1}$), and their relative intensities described as $s$ (strong), $m$ (medium), or $w$ (weak). When applicable, peak shape was characterised by $br.$ (broad) or $sh.$ (shoulder).

1.2. Fluorescence
Fluorescence measurements were performed on a BMG Labtech CLARIOstar® plate reader using Greiner bio-one microplates, 96-well, PS, flat-bottom (chimney well), black. Data were collected via the BMG Labtech Clariostar data analysis software package MARS. All solvents used in fluorescence measurements were HPLC or fluorescence grade and the water was de-ionised.

UV-Vis measurements were performed on a Perkin-Elmer Lambda20 Spectrophotometer, utilising Starna Silica (quartz) cuvette with 10 mm path lengths, two faces polished. Data was collected via the Perkin-Elmer UVWinlab software package.

All pH measurements taken for buffer pH adjustments were recorded on a Hanna Instrument HI 9321 microprocessor pH meter which was routinely calibrated using Fishers standard buffer solutions (pH 4.0 – phthalate, 7.0 – phosphate, and 10.0 – borate).

Phosphate buffered saline (PBS) was freshly prepared from 52 % methanol in water with KCl (10 mM), KH$_2$PO$_4$ (2.75 mM) and Na$_2$HPO$_4$ (2.76 mM). The PBS buffer was adjusted to pH 7.4/8.2 with 1 M HCl (aq.) as indicated.

Stock solutions for a variety of ROS were freshly prepared prior to each experiment:

**Hydrogen peroxide (H$_2$O$_2$)**
Hydrogen peroxide (H$_2$O$_2$) is commercially available whereby the concentration of H$_2$O$_2$ was determined through spectrophotometrical analysis with $\varepsilon = 43.6$ cm$^{-1}$ M$^{-1}$ at 240 nm.

**Peroxynitrite (ONOO$^-$)**
Peroxynitrite (ONOO$^-$) stock solutions were freshly prepared each time prior to usage. A solution of 3 M NaOH was cooled to 0 °C to which simultaneously 0.7 M H$_2$O$_2$, 0.6 M NaNO$_2$ and 0.6 M HCl were added. The ONOO$^-$ solution was analyzed spectrophotometrically whereby the concentration of ONOO$^-$ was estimated through $\varepsilon = 1670$ cm$^{-1}$ M$^{-1}$ at 302 nm in 0.1 M NaOH (aq.).

**Hypochlorite (ClO$^-$)**
Commercially available NaOCl was analysed spectrophotometrically to determine its concentration using $\varepsilon = 350$ cm$^{-1}$ M$^{-1}$ at 292 nm.

**Superoxide (O$_2$•$^-$)**
KO$_2$(0.0335 g) and 18-crown-6 ether (0.1235 g) were dissolved in DMSO (5 mL) and stirred for 5 min to produce a 0.1 M solution of O$_2$•$^-$. 

**Hydroxyl radical (•OH)**
Iron(II) perchlorate hydrate (0.1274 g) and H$_2$O$_2$ (3.9 µL) were dissolved in H$_2$O (5 mL) to produce a 0.1 M solution of •OH.

**Peroxyl radical (ROO$^.$)**
2,2′-Azobis(2-methylpropionamidine) dihydrochloride (0.136 g) was dissolved in H$_2$O (5 mL) and heated at 37 °C for 30 min to give a 0.1 M solution of ROO$^.$.

**Singlet oxygen (¹O$_2$)**
H$_2$O$_2$ (1.3 µL) was added to 4 mL of 0.1 M NaOCl to give a 0.1M solution of ¹O$_2$. 

Fluorescence titrations of ROS/RNS were carried out at 25 °C in PBS buffer pH 7.4/8.2. Different concentrations of ROS/RNS were prepared accordingly and investigated with the probe at a concentration ranging from 500 nM to 5 μM.

1.3. In vitro Studies

1.3.1. Cell Culture
RAW 264.7 macrophages (ATCC® TIB-71™) and HeLa cells (ATCC® CCL-2™) were maintained in a Dulbecco’s Modified Eagle’s Medium (DMEM, Gibco, 12800082) supplemented with 10 % FBS (Gibco, 2025790) in a humidified atmosphere of 5 % CO₂ and 95 % air at 37 °C and split when the cells reached 90 % confluency.

1.3.2. Cell Viability Assay
Cells were plated on clear bottom 96-well plates (Corning, 3599) in growth medium. After 24 h, cells were treated with probes at different concentrations (0, 5, 10, 20, and 40 μM) for 24 h. Then, a solution of MTS/PMS (20:1, Promega Corp, G5430) (10 μL/well) was added to each well. After incubation at 37 °C under 5 % CO₂ for 2 h, the absorbance of the solutions was measured at 490 nm using a M5 microplate reader (Molecular Device, USA). The optical density of the result in the MTS assay was directly proportional to the number of viable cells.

1.3.3. RNA isolation and quantitative RT-PCR.
Total RNA was isolated from RAW 264.7 macrophages treated with or without different reagents using TRIzol reagent (Invitrogen, 15596018). The cDNA was prepared using PrimeScript Reverse Transcriptase (TaKaRa, RR036A) according to the manufacturer’s instructions. After a 10-fold dilution, the gene expression was amplified using 2x SYBR Green qPCR Master Mix (ABclonal, RK21203) with a Stratagene Mx3005P (Agilent Technologies). qPCR values were normalized to GAPDH. Statistical analysis was performed with GraphPad PRISM (GraphPad Software, Inc.) using Student’s unpaired t-test. The following primer sequences were synthesized from Sangon Biotech (Shanghai) Co., Ltd.: GAPDH: 5’-TCTCTCGACCTTCAACA-3’ (forward), 5’-TGTCAGGTGTTTCTTACT-3’ (reverse); cyclooxygenase (COX)-2: 5’-CTGGGAACATGGACTCAGTTTG-3’ (forward), 5’-AGGCTTTGCCCACCTGTTG-3’ (reverse).

1.3.4. Confocal Laser Scanning Microscopy
HeLa and RAW 264.7 macrophages were plated on 24-well plates (Corning, 3524) in DMEM plus 10 % FBS. The cells were cultured overnight at 37 °C in a humidified atmosphere of 5 % CO₂ and 95 % air. First, cells were incubated with an ONOO⁻ donor (SIN-1) to evaluate sensitivity to exogenous ONOO⁻. Cells were incubated with the probe (20 μM, 1% DMSO in PBS, pH 7.4) for 30 min, followed by incubation with SIN-1 (500 μM) for 30 min at 37 °C. To confirm the detection of exogenously generated ONOO⁻, the cells were pre-incubated with uric acid (100 μM) for 2 h and then SIN-1 (500 μM) for 30 min followed by the probe (20 μM) for 30 min at 37 °C. To generate endogenous ONOO⁻, LPS (1 μg mL⁻¹) was first incubated for 24 h in RAW 264.7 macrophages at 37 °C. After washing the LPS-primed cells with PBS twice, the cells were incubated with the probe (20 μM) for 30 min at 37 °C. The cells were then washed three times with PBS and fixed by 4 % paraformaldehyde for 20 min at RT. After rinsing twice with PBS, the nuclei of the fixed cells were stained with Hoechst 33342 (5 μg
mL−1) at 37 °C in a humidified atmosphere of 5 % CO2 in air for 5 min. The cells were then washed three times with PBS, the fluorescent signals were analysed using a confocal laser scanning microscopy (FV1000, Olympus, Japan) with λex = 559 nm and λem = 580-650 nm for probes and λex = 405 nm and λem = 450-480 nm for Hoechst 33342. Fluorescent cell images were analyzed and exported via FV10-ASW software (Olympus).

1.4. In vivo Studies

All animal experiments were carried out under the Guidelines for Care and Use of Laboratory Animals of Shanghai Institute of Materia Medica (SIMM), Chinese Academy of Sciences and approved by the Institutional Animal Care and Use Committee (IACUC) of SIMM (Shanghai, China). In addition, the procedures performed at SIMM were approved (NL1907-1) by the Animal Welfare & Ethical Review Body (AWERB) at the University of Bath.

Animals were housed in a SPF temperature-controlled room (22 ± 2°C) under a 12 h light/dark cycle in the Shanghai Institute of Materia Medica (SIMM) of the Chinese Academy of Science. Animals were anesthetized with pentobarbital sodium (50 mg/kg). At the end of the study, the mice were euthanized with CO2 asphyxiation without recovery from the anaesthesia, according to the rules of the Animal Care and Use Committee of the Shanghai Institute of Materia Medica. Mice were divided into four groups and three mice were used in each group from three independent experiments. In addition, four mice were used for preliminary experiments to explore conditions.

8-week-old male C57BL/6J mice were divided into two groups; the first group was given an intraperitoneal (i.p.) injection of saline (200 μL) as a control group, and the second group was injected i.p. with LPS (200 μL, 2 mg mL−1 in saline, Sigma Aldrich, L2630). After 4 h, animals were anesthetized and abdominal fur was removed using a razor. Then, mice were injected i.p. with the probe (100 μL, 200 μM in saline) or saline (100 μL). Whole body images were acquired in 30 min by using the IVIS spectrum imaging system (PerkinElmer, USA). The imaging mode was set as: λex = 550 nm, λem = 580-620 nm. Quantitative analysis of data was carried out with the Living Image 4.0 software where the average signal intensity using the saline group was normalized to 1. Statistical analysis was performed with GraphPad PRISM (GraphPad Software, Inc.) using Student’s unpaired t-test. P-values <0.05 was considered statistically significant.
2. Synthesis

10-(4-methoxybenzyl)-10H-phenoxazine

Phenoxazine (1.00 g, 5.46 mmol) and NaH, 60 % in mineral oil (0.26 g, 10.90 mmol) were added to dry DMF (30 mL) and cooled to 0 ºC. After stirring for 10 min, 4-methoxybenzyl chloride (0.85 g, 5.45 mmol) in DMF (10 mL) was added dropwise to the reaction mixture and left to stir at RT for 4 h. The reaction mixture was then quenched via dropwise addition of H₂O. The mixture was partitioned with EtOAc (100 mL) and H₂O (100 mL). The organic layer was washed with H₂O (3 x 50 mL) and brine (1 x 50 mL), dried over MgSO₄, filtered and concentrated in vacuo to afford 10-(4-methoxybenzyl)-10H-phenoxazine (0.72 g, 43 %) as a brown solid.

1H NMR (300 MHz, CDCl₃): δ = 7.25 – 7.20 (m, 2 H; Ar H), 6.90 – 6.85 (d, J = 8.7 Hz, 2 H; ArH), 6.76 – 6.64 (t, J = 1.4 Hz, 6 H; ArH), 6.36 – 6.34 (d, J = 7.2 Hz, 1 H; ArH), 4.73 (s, 2 H; H–C(7′′)), 3.79 ppm (s, 3 H; H–C(1′′)); 13C NMR (75 MHz, CDCl₃): δ = 158.73, 145.15, 133.88, 127.99, 127.15, 123.71, 121.15, 115.23, 114.35, 112.19, 55.31, 48.70 ppm; m.p. 119 – 121 ºC; IR (ATR): 𝜐 = 2843.1 cm⁻¹ (s, O-CH₃); HR-ESI-MS: m/z (%): 304.1329 ([M+H]+, calcd for C₂₀H₁₈NO₂+: 304.2337).

3,7-dibromo-10-(4-methoxybenzyl)-10H-phenoxazine

To a solution of 4-((3,7-dibromo-10H-phenoxazin-10-yl)methyl)methyl ester (0.67 g, 2.22 mmol) in CHCl₃ (100 mL), NBS (0.78 g, 4.43 mmol) was added portion-wise and the reaction was left to stir for 1 h. The reaction was quenched with H₂O (100 mL) and the organic layer was washed with H₂O (3 x 50 mL) and brine (1 x 100 mL), dried over MgSO₄, filtered and concentrated in vacuo to afford 3,7-dibromo-10-(4-methoxybenzyl)-10H-phenoxazine (0.91 g, 89 %) as a green solid.

1H NMR (300 MHz, CDCl₃): δ = 7.17 – 7.14 (d, J = 8.5 Hz, 2 H; ArH), 6.89 – 6.86 (d, J = 8.7 Hz, 2 H; ArH), 6.83 – 6.80 (d, J = 6.9 Hz, 4 H; ArH), 6.21 – 6.18 (d, J = 9.1 Hz, 2 H; ArH), 4.66 (s, 2 H; H–C(7′′)), 3.79 ppm (s, 3 H; H–C(1′′)); 13C NMR (75 MHz, CDCl₃): δ = 158.98, 145.35, 132.71, 127.99, 127.79, 123.71, 121.15, 115.23, 114.35, 112.19, 55.31, 48.70 ppm; m.p. 119 – 121 ºC; IR (ATR): 𝜐 = 2836.4 cm⁻¹ (s, O-CH₃); HR-ESI-MS: m/z (%): 461.9519 ([M+H]+, calcd for C₂₀H₁₆NO₂Br²⁺: 461.9520).
10-(4-methoxybenzyl)-3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazine

4-((3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazin-10-yl)methyl)methyl ester (1.00 g, 2.16 mmol), bis(pinacolato)diboron (1.65 g, 6.51 mmol), KOAc (1.28 g, 13.04 mmol) and Pd(dppf)Cl\(_2\) (0.16 g, 0.27 mmol) were dissolved in anhydrous DMF (15 mL) and refluxed under argon for 2 h. The reaction was cooled to RT and partitioned with EtOAc (50 mL) and H\(_2\)O (50 mL). The organic layer was washed with H\(_2\)O (3 x 50 mL), brine (1 x 50 mL), dried over MgSO\(_4\), filtered and concentrated in vacuo. Trituration with petroleum ether 40-60 (100 mL) afforded 10-(4-methoxybenzyl)-3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazine (0.41 g, 41 %) as a brown solid.

10-((4-propoxybenzyl)-3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazine

4-((3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazin-10-yl)methyl)phenol (300 mg, 0.55 mmol) was dissolved in THF (30 mL). NaH–60 % mineral oil (32 mg, 0.83 mmol) was added, followed by dropwise addition of propargyl bromide – 80 wt% in toluene (0.15 mL, 0.83 mmol). The mixture was stirred at RT for 20 h. The reaction was quenched with MeOH (20 mL), diluted with EtOAc (30 mL), washed with water (3 x 60 mL), dried over MgSO₄, filtered and evaporated in vacuo. FC (SiO₂; petroleum ether/EtOAc 80:20) gave 10-((4-propoxybenzyl)-3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazine (130 mg, 41 %) as a yellow solid.

¹H NMR (500 MHz, CDCl₃): δ = 7.20 – 7.11 (m, 4 H; ArH), 7.10 – 7.03 (m, 2 H; ArH), 6.79 (dd, J = 8.5, 6.1 Hz, 1 H; ArH), 6.70 – 6.64 (m, 1 H; ArH), 6.34 (dd, J = 7.9, 3.8 Hz, 2 H; ArH), 4.72 (s, 2 H; H–C(7'')), 4.12 (q, J = 7.2 Hz, 2 H; H–C(1''')), 1.30 (s, 24 H; H–C(2''''), H–C(3''''), H–C(5''''), H–C(6''''), H–C(2'''''), H–C(3'''''), H–C(5'''''), H–C(6''''''), 1.28 – 1.23 (m, 2 H; H–C(2'''')) 0.89 – 0.83 ppm (m, 3 H; H–C(3'''))

¹³C NMR (126 MHz, CDCl₃): δ = 154.99, 144.73, 136.06, 130.96, 127.33, 127.30, 127.15, 120.97, 115.80, 111.73, 83.69, 48.10, 29.70, 24.78, 14.19, 1.02 ppm; m.p. 217 – 220 °C; IR (ATR): ν = 1138 cm⁻¹ (m, C–O–C); HR-ESI-MS: m/z (%): 581.3365 ([M]^+), calcd for C₃₄H₃₃O₆N₁₀B₂⁺: 581.3349).
4-((3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazin-10-yl)methyl)phenyl pentanoate

4-((3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazin-10-yl)methyl)phenol (200 mg, 0.37 mmol) was dissolved in DCM (30 mL). The solution was cooled to 0 °C. First triethylamine (0.10 ml, 0.74 mmol) was added, followed by dropwise addition of valeroyl chloride (0.1 ml, 0.74 mmol). The mixture was stirred for 4 h at RT. The reaction was quenched with water, and the phases were separated. The organic phase was washed with water (3 x 20 ml), dried over MgSO₄, filtered and evaporated in vacuo. FC (SiO₂; petroleum ether/EtOAc 80:20) gave 4-((3,7-bis(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-10H-phenoxazin-10-yl)methyl)phenyl pentanoate (72 mg, 31%) as a yellow/orange solid.

**4-((10H-phenoxazin-10-yl)methyl)benzonitrile**

Phenoxazine (250 mg, 1.37 mmol) was dissolved in THF (15 mL). The mixture was cooled to 0 °C and left to stir for 10 min. NaH – 60% mineral oil (68 mg, 1.78 mmol) was slowly added. After 10 min, 4-(bromomethyl)benzonitrile (269 mg, 1.37 mmol) was slowly added. The solution was left to stir at RT for 7 h. The mixture was quenched with water (10 mL). After separation of the phases, the aqueous layer was extracted with EtOAc (2 x 20 mL). The combined organic layers were washed with water (3 x 20 mL), and brine (20 mL), dried over MgSO$_4$, filtered and evaporated in vacuo. FC (SiO$_2$; petroleum ether/EtOAc 90:10) gave 4-((10H-phenoxazin-10-yl)methyl)benzonitrile (313 mg, 77%) as a dark brown solid.

$^1$H NMR (300 MHz, CDCl$_3$): δ = 7.64 (d, J = 8.3 Hz, 2 H; ArH), 7.44 (d, J = 8.0 Hz, 2 H; ArH), 6.78 – 6.62 (m, 6 H; ArH), 6.28 – 6.19 (m, 2 H; ArH), 4.82 ppm (s, 2 H; H–C(7’’)); $^{13}$C NMR (75.5 MHz, CDCl$_3$): δ = 145.28, 142.97, 142.51, 132.96, 132.74, 129.85, 127.07, 123.92, 121.94, 115.78, 112.05, 49.35 ppm; m.p. 143 – 145 °C; IR (ATR): $\tilde{\nu}$ = 2229 (m, C≡N), 1112 cm$^{-1}$ (s, C–O); FTMS + p NSI MS: m/z (%): 299.1182 ([M + H]$^+$), calcd for C$_{20}$H$_{15}$N$_2$O$^+$: 299.1179.

Author Contributions
M.W. and A.C.S. conceived and designed the research. M.W. conducted the synthesis and fluorescence experiments and carried out data analyses with M.L.O and C.E.F.J. supporting on some of these aspects. H.-H.H. conducted cell experiments. B.L. conducted in vivo experiments. Y.Z and J.L supported H.-H.H. and B.L. The manuscript was written by M.W with support from A.C.S., T.D.J, H.-H.H. and X.P.H. S.D.B, A.B.M, and J.L. offered guidance on the project. All authors read and approved the final manuscript.
