I. General information

Unless stated otherwise, *chemically* based reactions were conducted in flame-dried glassware under a positive pressure of argon. Thin-layer chromatography (TLC) was conducted with E. Merck silica gel 60 F254 pre-coated plates, (0.25 mm) and visualized by exposure to UV light (254 nm) or stained with phosphomolybdic acid, or potassium permanganate. Column chromatography was performed using Fluka silica gel 60 Å (100-200 mesh) and Fluka Florisil® Adsorbent for Chromatography (40-63 mm, 230-400 mesh). NMR spectra were recorded on Bruker spectrometer (AVIII400) and are reported relative to residual deuterated solvent signals. Chemical shifts are reported in parts per million (ppm) with respect to the residual solvent signal $CDCl_3$ (^{1}H NMR: δ = 7.24; ^{13}C {^{1}H} NMR: δ = 77.00) or C_6D_6 (^{1}H NMR: δ = 7.15; ^{13}C {^{1}H} NMR: δ = 128.00). ^{11}B NMR chemical shifts are reported in ppm with absolute reference relative to ^{1}H. Peak multiplicities are reported as follows: s = singlet, d = doublet, t = triplet, dd = doublet of doublets, td = triplet of doublets, m = multiplet. High-resolution mass spectra (HRMS) were obtained by the mass spectrometry facility of the Technion. Reactions were monitored by gas chromatography spectrometry (GC) using an Agilent Technologies 7820A GC with an Agilent Technologies 19091J-413 (30 m × 0.3 mm) column. Melting points were obtained using a STUART melting point SMP11 with a alcohol thermometer. THF and diethyl ether were dried from Pure-Solv® Purification System (Innovative Technology©). Toluene was distilled over sodium/benzophenone prior to use. All other commercially obtained reagents were used as received.

General procedure for isomerization of homoallylboronate 1a. Under argon atmosphere, a flame-dried Schlenk tube was charged with the specified transition-metal catalyst (Grotjahn's catalyst **Cat_1,** $RhH(CO)(PPh_3)_3$ **Cat_2**, $RuH_2(CO)(PPh_3)_3$ **Cat_3** or $RuHCl(CO)(PPh_3)_3$ **Cat_4**, 2.5-5 mol%). The tube was put under vacuum and backfilled with argon (3 times), and then a solution of **1a** (50 mg, 0.297 mmol, 1.0 equiv) in the specified anhydrous solvent (1,2-dichloroethane, toluene, pinacolone or THF, 1.5 mL) was added under an inert atmosphere of argon by a syringe. The reaction mixture was then heated at the indicated temperature and allowed to stir for the specified time. After the reaction had reached to the specified time, the resulting mixture was cooled to room temperature and quenched by evaporation of the solvent. The crude residue was purified by pouring into pentane (ca. 3 mL) to precipitate catalyst, followed by filtering through a short pad of silica gel (see below apparatus) with copious washings by pentane/diethyl ether (20:1) and concentrated. Repeating the described purification procedure until no more precipitate forms (2 to 3 times) to provide the vinylboronate product **2a** along with partial inseparable *E*- and *Z*-allyl isomers as a clear oil.

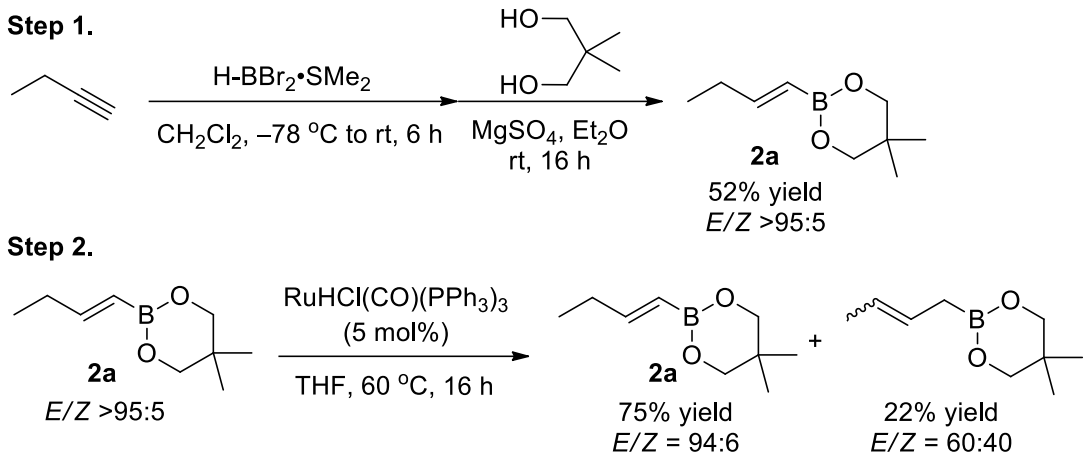
V. Experiments on reverse isomerization of vinylboronates

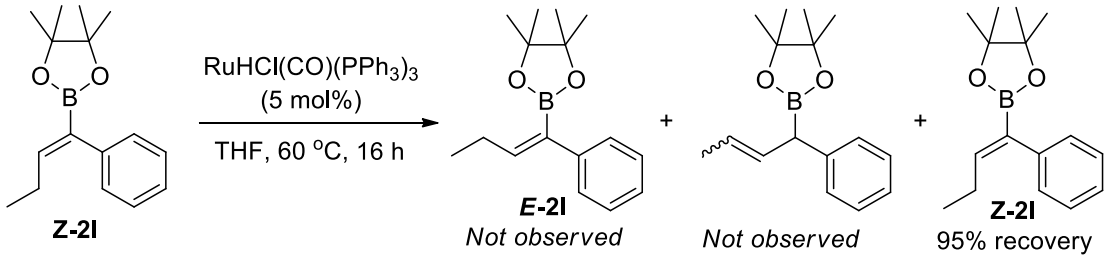
1. The examination of reverse isomerization of vinylboronate 2a



Step 1: Preparation of vinylboronate 2a from hydroboration. Based on a literature procedure.[11] A solution of condensed 1-butyne (7 mL, 87 mmol, 1.75 equiv) in CH_2Cl_2 (5 mL) was added to a CH_2Cl_2 solution of dibromoborane dimethylsulfide complex (1M in CH_2Cl_2, 50 mL, 50 mmol, 1.0 equiv) at −78°C. The mixture was allowed to warm to room temperature during 6 h. The mixture was quenched with 2M NaOH (63 mL, 125 mmol, 2.5 equiv) in an ice bath and extracted with EtOAc (2 × 50 mL). The organic extracts were combined, dried over Na_2SO_4, filtered, and concentrated. The residue was dissolved in anhydrous diethyl ether (70 mL), 2,2-dimethylpropane-1,3-diol (5.7g, 55 mmol, 1.1 equiv) and $MgSO_4$ (7.2 g, 60 mmol, 1.2 equiv) were added. The mixture was stirred for 16 h at room temperature. The suspension was filtered and washed with copious amounts of diethyl ether, and then concentrated. The crude residue was purified by flash column chromatography on silica gel (petroleum ether/diethyl ether = 100:0 to 10:1) to give the vinylboronate **2a** as a clear oil (4.36 g, 52%). The NMR spectra data are already described on page S6.

Step 2: Ru-catalyzed Isomerization of vinylboronate 2a. Under argon atmosphere, $RuHCl(CO)(PPh_3)_3$ (14 mg, 0.015 mmol, 5 mol%) was added to a flame-dried Schlenk tube equipped with a magnetic stir bar. The tube was put under vacuum and backfilled with argon (3 times). A solution of **2a** (50 mg, 0.297 mmol, 1.0 equiv) in THF (1.5 mL) was added by syringe and stirred at 60 °C. After 16 h, the mixture was cooled to room temperature and quenched by evaporation of the solvent. The crude residue was purified by flash column chromatography on silica gel (petroleum ether/diethyl ether = 20:0 to 10:1) to give compound **2a** along with partial inseparable *E*- and *Z*-allyl isomers as a clear oil (48 mg, 0.286 mmol, 96% yield). Using ^{1}H NMR spectroscopic analysis for a mixture of purified products, compound **2a** was observed in 74% yield with *E*/*Z* = 94:6, the corresponding allyl isomers were observed in 22% yield.

2. The examination of reverse isomerization of vinylboronate *Z*-2l



Ru-catalyzed Isomerization of vinylboronate *Z*-2l. According to a modified procedure as described above in **Step 2**. Using $RuHCl(CO)(PPh_3)_3$ (18 mg, 0.019 mmol), vinylboronate ***Z*-2l**[16] (100 mg, 0.387 mmol) and anhydrous THF (1.6 mL). After work-up, the formation of ***E*-2l** and the corresponding ally isomers was not observed in the ^1H NMR spectroscopic analysis of crude residue. Purification by flash column chromatography on silica gel (petroleum ether/ethyl acetate = 30:1) recovered starting material ***Z*-2l** in 95% yield with *E*/*Z* > 95:5 as a pale-yellow oil (95 mg, 0.368 mmol).

VI. Structure elucidation of *E*-2k and *Z*-2i

2. Determination of relative configuration of *Z*-2i-Bdan
