1. General methods

All reactions that were carried out in oven dried glassware and under an atmosphere of nitrogen is stated at the start of the reaction conditions. For flash chromatography, distilled technical grade solvents were used. THF, CH₃CN, toluene, Et₂O and CH₂Cl₂ were dried by passage over activated alumina under nitrogen atmosphere (H₂O content < 10 ppm, Karl-Fischer titration). The solvents were degassed by Freeze-Pump-Thaw method when mentioned. All chemicals were purchased from Acros, Aldrich, Fluka, VWR, TCI, Merck and used as such unless stated otherwise. Chromatographic purification was performed as flash chromatography using Macherey-Nagel silica 40-63, 60 Å, using the solvents indicated as eluent with 0.1-0.5 bar pressure. TLC was performed on Merck silica gel 60 F254 TLC glass plates and visualized with UV light and *p*-anisaldehyde stain (EtOH:H₂SO₄:AcOH:*p*-anisaldehyde 135:5:1.5:3.7 V:V:V:V).

¹H-NMR spectra were recorded on a Bruker DPX-400 400 MHz spectrometer in chloroform-*d*, acetonitrile-*d*₃, DMSO-*d*₆ or acetone-*d*₆, all signals are reported in ppm with the internal chloroform signal at 7.26 ppm, the internal acetonitrile signal at 1.94 ppm, the internal methanol signal at 3.30 ppm, the internal DMSO signal at 2.50 ppm or the internal acetone signal at 2.05 ppm as standard. The data is reported as (s = singlet, d = doublet, t = triplet, q = quadruplet, qi = quintet, m = multiplet or unresolved, br = broad signal, app = apparent, coupling constant(s) in Hz, integration, interpretation). ¹³C-NMR spectra were recorded with ¹H-decoupling on a Bruker DPX-400 100 MHz spectrometer in chloroform-*d*, acetonitrile-*d*³, CD₃OD, DMSO-*d*⁶ or acetone-*d*⁶, all signals are reported in ppm with the internal chloroform signal at 77.0 ppm, the internal acetonitrile signal at 1.3 ppm, the internal methanol signal at 49.0 ppm, the internal DMSO signal at 39.5 ppm or the internal acetone signals at 29.84 and 206.26 ppm as standard. Rotameric mixtures have been described at room temperature as a mixture of rotamers, only the split signals have been assigned to the major or minor rotamer. Regiomeric mixtures have been assigned based on the shift of the characteristic proton signals. Diastereoisomers have been separated when possible if not assigned based on ¹H NMR analysis.

Infrared spectra were recorded on a JASCO FT-IR B4100 spectrophotometer with an ATR PRO410-S and a ZnSe prisma and is reported in cm⁻¹ (w = weak, m = medium, s = strong, br = broad).

High resolution mass spectrometric measurements were performed by the mass spectrometry service of ISIC at the EPFL on a MICROMASS (ESI) Q-TOF Ultima API.

All photoredox catalyzed reactions were carried out in oven dried glassware and under inert atmosphere (freeze pump thaw solvent stored on molecular sieves and under argon for maximum one week) unless specified otherwise. They were performed in test tubes (5 and 10 mL) which were held using a rack for test tubes placed at the center of a crystallization dish or screw cap vials (0.5 – 10 mL) which were stuck to the base of the crystallization dish. In order to keep the temperature as constant as possible all reactions were ventilated by use of an over-head ventilator (desk fan). To the crystallization dish (a straight sided 15 cm diameter pyrex dish) were attached the blue LEDs (RUBAN LED 5MÈTRES - 60LED/M - 3528 BLEU - IP65

with Transformateur pour Ruban LED 24W/2A/12V, bought directly on RubanLED.com). The distance between the LEDs and the test tubes was approximately 3 cm for all vials and test tubes. Long irradiation resulted in temperature increasing up to 27 °C during overnight reactions. Photos have been provided.

UV/Vis spectroscopy was performed on an Agilent Cary 60 UV-Vis and steady-state luminescence spectroscopy was recorded on a Varian Cary Eclipse spectrophotometer. Cyclic voltammetry experiments were performed on a Biologic SP-150 Potentiostat, with a three-electrode cell configuration: a glassy carbon electrode as the working electrode, Pt wire as a counter electrode and an Ag/AgCl (KCl, 3M) electrode as the reference electrode. Bu_4NPF_6 was employed as the electrolyte (0.1 M).

Synthesis of the hypervalent iodine reagents

The synthesis of reagents **2**, and **11a-11f** had already been described before by our group. The procedures are taken from the indicated publications to facilitate reproduction of the results by having all data in the same file.

1-Hydroxy-1,2-benziodoxol-3-(1*H*)-one (**6**)

Following a reported procedure,¹ NaIO₄ (40.5 g, 189 mmol, 1.05 equiv) and 2-iodobenzoic acid (**17**) (44.8 g, 180 mmol, 1.0 equiv) were suspended in 30% (v:v) aq. AcOH (350 mL). The mixture was vigorously stirred and refluxed for 5 h. The reaction mixture was then diluted with cold water (250 mL) and allowed to cool to rt, protecting it from light. After 1 h, the crude product was collected by filtration, washed on the filter with ice water (3 x 150 mL) and acetone (3 x 150 mL), and air-dried in the dark overnight to afford 1-Hydroxy-1,2-benziodoxol-3-(1*H*)-one (**6**) (44.3 g, 168 mmol, 93% yield) as a white solid.

1-Acetoxy-1,2-benziodoxol-3-(1*H*)-one (**7**)

Following a reported procedure,² compound **6** (3.00 g, 11.3 mmol, 1.00 equiv) was heated in Ac₂O (10 mL) to reflux until the solution turned clear (without suspension, ca. 30 min). The mixture was then left to cool down and white crystals started to form. The crystallization was continued at -18 °C. The crystals were then collected and dried overnight under high vacuum to give compound **7** (3.06 g, 10.0 mmol, 86% yield).

¹H NMR (400 MHz, Chloroform-*d*₃) δ 8.25 (dd, 1 H, *J* = 7.6, 1.4 Hz, Ar*H*), 8.00 (dd, 1 H, *J* = 8.3, 0.5 Hz, Ar*H*), 7.92 (dt, 1 H, *J* = 7.0, 1.7 Hz, Ar*H*), 7.71 (td, 1 H, *J* = 7.6, 0.9 Hz, Ar*H*), 2.25 (s, 3 H, COCH₃). NMR data correspond to the reported values.²

1-[Phenylethynyl]-1,2-benziodoxol-3(1H)-one (**2**)

Following a reported procedure,¹ trimethylsilyltriflate (9.1 mL, 50 mmol, 1.1 equiv) was added dropwise to a suspension of 2-iodosylbenzoic acid (**6**) (12.1 g, 45.8 mmol, 1.0 equiv) in CH_2Cl_2 (120 mL) at 0 °C. The mixture was stirred for 1 h, followed by the dropwise addition of trimethyl(phenylethynyl)silane (**18**) (8.8 mL, 50 mmol, 1.1 equiv) (slightly exothermic). The resulting suspension was stirred for 6 h at RT, during this time a white solid was formed. A saturated solution of NaHCO_3 (120 mL) was added and the mixture was stirred vigorously for 30 min. The resulting suspension was filtered on a glass filter. The two layers of the mother liquors were separated and the organic layer was washed with sat. NaHCO_3 (2x50 mL), dried over MgSO_4 , filtered and evaporated under reduced pressure. The resulting mixture was combined with the solid obtained by recrystallisation in EtOAc:MeOH (2:1, ca. 28 mL/g). The mixture was cooled down, filtered and dried under high vacuum to afford Ph-EBX (**2**) (6.8 g, 25 mmol, 43% yield) as colorless crystals.

Consistent with reported data.¹

1-[4-Trifluoromethylphenylethynyl]-1,2-benziodoxol-3(1H)-one (**11a**)

Following a reported procedure,³ trimethylsilyl triflate (1.0 mL, 5.5 mmol, 1.1 equiv) was added to a suspension of 2-iodosylbenzoic acid (**6**) (1.3 g, 5.0 mmol, 1.0 equiv) in CH_2Cl_2 (15 mL) at RT. The resulting suspension was stirred for 1 h, followed by the dropwise addition of trimethyl(4-(trifluoromethyl)phenylethynyl)silane (**19a**) (1.3 mL, 5.5 mmol, 1.1 equiv), which was dissolved in CH_2Cl_2 (1 mL). The resulting suspension was stirred for 6 h at RT. A saturated solution of NaHCO_3 (20 mL) was then added and the mixture was stirred vigorously for 30 min, the two layers were separated and the organic layer was washed with sat. NaHCO_3 (20 mL), dried over MgSO_4 , filtered and evaporated under reduced pressure. The resulting solid was boiled in CH_3CN (20 mL). The mixture was cooled down, filtered and dried under high vacuum to afford **11a** (1.3 g, 3.2 mmol, 64% yield) as a pale yellow solid.

Triisopropylsilyl trimethylsilylacetylene (**19f**)

Following a reported procedure,⁹ *n*-butyllithium (2.5 M in hexanes, 28 mL, 70 mmol, 0.98 equiv) was added dropwise to a stirred solution of ethynyltrimethylsilane (**20**) (7.0 g, 71 mmol, 1.0 equiv) in THF (100 mL) at -78 °C. The mixture was warmed to 0 °C and stirred for 5 min. The mixture was then cooled back to -78 °C and chlorotriisopropylsilane (15 mL, 71 mmol, 1.0 equiv) was added dropwise. The mixture was then allowed to warm to room temperature and stirred overnight. A saturated solution of ammonium chloride (100 mL) was added, and the reaction mixture was extracted with diethyl ether (2 x 100 mL). The combined organic layers were washed with water and brine, then dried over MgSO₄, filtered and concentrated under reduced pressure to obtain a colorless liquid which was further purified by filtration on silica eluting with pentane (500 mL) to yield **19f** (16 g, 64 mmol, 90% yield) as a colorless liquid.

3-Bromopropyl 4-((trimethylsilyl)ethynyl)benzoate (**19g**)

Following a reported procedure,¹² 4-(dimethylamino)-pyridine (67 mg, 0.55 mmol, 12 mol%) was added to a stirred reaction mixture of 4-((trimethylsilyl)ethynyl)benzoic acid (**21**) (1.0 g, 4.6 mmol, 1.0 equiv), dicyclohexylcarbodiimide (1.0 g, 5.0 mmol, 1.1 equiv), 3-bromopropan-1-ol (0.62 mL, 6.9 mmol, 1.5 equiv) in dry CH₂Cl₂ (15 mL) at room temperature. The reaction mixture was filtered after 15 h and the solid was rinsed with dichloromethane (2 x 10 mL). The combined filtrates were concentrated under vacuum. Purification by column chromatography pentane:ethyl acetate 9:1 afforded 3-bromopropyl 4-((trimethylsilyl)ethynyl)benzoate (**19g**) (1.3 g, 3.8 mmol, 82 % yield) as a white solid.

1-[(4-(3-Bromoprop-1-yl-benzoate)ethynyl]-1,2-benziodoxol-3(1*H*)-one (**11g**)

Based on a reported procedure,¹² **6** (0.354 g, 1.34 mmol) was charged into a flame-dried 25 mL round bottomed flask equipped with a magnetic stirring bar and dry CH₂Cl₂ (Volume: 3.83 mL) was added. To the later suspension, trimethylsilyl trifluoromethanesulfonate (0.28 mL, 1.5 mmol) was added dropwise over a period of 20 min resulting in a yellowish suspension. The reaction was stirred for 1 hour, at that time, 3-bromopropyl 4-((trimethylsilyl)ethynyl)benzoate (**19g**, 0.500 g, 1.47 mmol) was added portionwise. The suspension coloured grey. The reaction was then stirred 6 hours at room temperature. The reaction was quenched with sat. aq. NaHCO₃ (3.5 mL) and stirred for 2 h at 25 °C. A persistent emulsion was obtained, the solution was diluted with 50 mL of EtOAc and 20 mL of water. The organic layer was separated then washed with brine:H₂O 1:1 (50 mL). The organic layer was concentrated to provide an orange crude oil and crude precipitate. The latter was recrystallised from MeCN (ca. 40 mL for 1.0 g of crude). **11g** (0.430 g, 0.838 mmol, 63% yield) was obtained as an off-white partially crystalline solid.

1-[(3-(Prop-2-en-1-yl)benzoate)ethynyl]-1,2-benziodoxol-3(1*H*)-one (**11h**)

Based on a reported procedure,¹² in an oven-dried 20 mL microwave vial equipped with a magnetic stirring bar, **6** (0.500 g, 1.89 mmol, 1.00 equiv) was suspended in dry CH₂Cl₂ (6 mL, 0.31 M). To the later suspension, trimethylsilyl trifluoromethanesulfonate (0.4 mL, 2 mmol, 1.1 equiv) was added dropwise over a period of 10 min resulting in a yellowish suspension. The reaction was stirred for 1 hour, at that time, allyl 3-ethynylbenzoate (**19h**, 0.388 g, 2.08 mmol, 1.10 equiv) was added dropwise. The suspension coloured grey. The reaction was then stirred 18 hours at 40 °C. The reaction was quenched with sat. aq. NaHCO₃ (10 mL) and stirred for 1 h. The layers were separated and the aqueous layer was back-extracted with CH₂Cl₂ (3 x 7 mL). The organic layers were combined, washed with brine:H₂O (1:1) dried over Na₂SO₄ and filtered. The total volume of CH₂Cl₂ was ca. 30 mL. ca. 10 mL of heptane were added. CH₂Cl₂ was removed slowly under reduced pressure until solution clouded. The solution was then left to cool to RT then placed in fridge (5 °C) for 1 h. At this time crystals had started to form. Crystalization proceeded at RT stirring the solution every 5 min with a spatula for 30 min. **11h** (0.312 g, 0.722 mmol, 38% yield) was obtained as an off-white slightly crystalline powder.

General procedure A: Synthesis of the photocatalysts

Sodium hydride (60% suspension in mineral oil, 8.0 equiv) was added slowly to a stirred solution of substituted-carbazole **23a-b** (5.0 equiv) in dry THF (0.05 M) under a nitrogen atmosphere at RT. After 30 min, 2,4,5,6-tetrafluoroisophthalonitrile **24** (1.0 mmol, 1.0 equiv) was added. After stirring at RT for 15 h, 2 mL water was added to the reaction mixture to quench the excess of NaH. The resulting mixture was then concentrated under reduced pressure. The crude product was purified by recrystallization from hexane:CH₂Cl₂ then filtered. The brown liquid filtrate was concentrated and recrystallized as before. The combined solids were then purified by column chromatography on silica gel with CH₂Cl₂:Hexane.

Synthesis of electron rich alkenes (1a-k and 9g)

General note on commercial alkenes:

N-vinyl pyrrolidinone (sodium hydroxide as inhibitor) (**1x**) and 2-chloroethyl vinyl ether (triethanolamine as stabiliser) (**9d**) were purchased from Sigma Aldrich. *n*Butyl vinyl ether (**9a**) and 3,4-dihydro-2H-pyran (**9g**) were purchased from Acros. ((Vinyloxy)methyl benzene (**9b**) and 2-ethoxy prop-1-ene (**9f**) were purchased from Fluorochem. Allyl vinyl ether (**9c**) was purchased from abcr. Cyclohexyl vinyl ether (stabilized with KOH) (**9e**) was purchased from TCI. All commercial alkenes were filtered over basic alumina before use and were used within 15 min without direct light exposition.

General note on synthesised alkenes:

All alkenes were used within 6 months of synthesis, stored at 4 °C and hidden from light. Some degradation (coloration) could be observed although it was not detrimental for the reaction yield.

N-vinyloxazolidin-2-one (**1a**)

Following a modified reported procedure,¹⁴ in a 25 mL round bottomed flask equipped with magnetic stirrer, bathophenanthroline (**26**, 0.015 g, 0.045 mmol, 0.05 equiv), Pd(OCOCF₃)₂ (**27**, 0.015 g, 0.045 mmol, 0.05 equiv) and oxazolidinone (**25**, 0.077 g, 0.904 mmol, 1.0 equiv) were dissolved in *n*butyl vinyl ether (**9a**, 1.0 mL, 7.8 mmol, 8.6 equiv). The flask was closed with a septum and then opened to the atmosphere by means of a needle (1.2 x 40 mm). The yellow suspension was then stirred at 75 °C for 2 hours. At this time, the mixture cooled down to room temperature. With no further treatment, the crude oil was then submitted directly to

Tert-butyl phenethyl(vinyl)carbamate (**1b**)

A flame-dried, 50 mL round-bottomed, two-necked flask was charged with anhydrous MgSO₄ (stored in the glove box; 4.5 g), closed, evacuated, and backfilled with nitrogen. CH₂Cl₂ (dry; 10 mL) was added followed by 2-phenylethanamine (**28**, 1.3 mL, 10 mmol, 1.0 equiv). The resulting suspension was cooled down to 0 °C (ice/water bath). Acetaldehyde (0.80 mL, 14 mmol, 1.4 equiv) was then added. The mixture was stirred and allowed to warm to room temperature over a period of 1 hour, and then stirred at room temperature for one additional hour. The solids were then removed through rapid filtration. CH₂Cl₂ was then distilled off (1 atm, 50 °C). To the crude imine was added a solution of di-*tert*-butyl dicarbonate (2.40 g, 11.0 mmol, 1.1 equiv) in toluene (dry; 5.0 mL), followed by DIPEA (freshly distilled over KOH; 1.8 mL, 11 mmol, 1.1 equiv). The resulting yellow solution was stirred at 70 °C for 3 hours. The reaction was stopped and the volatiles were removed under reduced pressure. The resulting crude yellow-orange oil was submitted to column chromatography (Biotage, 40 g SiO₂; EtOAc in pentane, 0 to 8%). The desired product was obtained as a mixture with unreacted Boc₂O. The excess Boc₂O was removed as following: the eluate was dissolved in EtOH (5 mL) and imidazole (300 mg) and DMAP (54.0 mg, 0.1 eq compared to imidazole) were added. The resulting mixture was stirred at room temperature for 10 minutes. It was then concentrated under reduced pressure. The crude oil was submitted to column chromatography (Biotage, 24 g SiO₂; EtOAc in pentane, 0 to 10%) to furnish pure *tert*-butyl phenethyl(vinyl)carbamate **1b** as a pale yellow oil (0.607 g, 2.45 mmol, 25% yield).

Benzyl phenethyl(vinyl)carbamate (**1c**)

To a flame dried flask and under argon, 2-phenethylamine (4.0 mL, 32 mmol, 1 equiv) and powered K₂CO₃ were suspended in anhydrous THF (125 mL, 0.25 M). Benzyl chloroformate (5.0 mL, 35 mmol, 1.1 equiv) was added dropwise to the suspension. The reaction was stirred at room temperature for 2 h. The solution was quenched with sat. aq. NaHCO₃ (40 mL) and the product was extracted with CH₂Cl₂ (3 x 30 mL). The combined organic layers were washed with sat. aq. NaHCO₃ (2 x 40 mL), dried over Na₂SO₄ and filtered. The solvent was removed under reduced pressure and the crude oil was purified by flash chromatography (SiO₂, Pentane : EtOAc 1 : 4) affording pure benzyl phenethylcarbamate (8.0 g, 31 mmol, 99% yield). The compound was used directly in next step.

In a 25 mL flask palladium trifluoroacetate (**27**, 0.415 g, 1.21 mmol) was dissolved in MeCN (29.9 mL). The flask was put under nitrogen and stirred at RT. A solution of 4,7-diphenyl-1,10-phenanthroline (**26**, 0.402 g, 1.21 mmol) in CH₂Cl₂ (Ratio: 1.000, Volume: 14.95 mL) was added. The dark brown solution was stirred overnight.

n-Hexane was added slowly under vigorous stirring (ca. 40 mL). The mixture was left to precipitate slowly over 30 min at rt. The suspension was cooled to 0 °C with an ice bath and the reaction was filtered and washed with pentane. 0.100 g of yellow complex was recovered. The filtrate was concentrated under reduced pressure, redissolved in a minimum of DCM (ca. 5 mL) and precipitated out with n-hexane. the suspension was cooled to 0 °C with an ice bath and was filtered a second time affording 0.563 g of yellow complex. The two batches were further dried on the high vacuum affording BphenPd(O₂C₂F₃)₂ (**30**, 0.595 g, 0.895 mmol, 73.9 % yield) (0.095 of first batch and 0.500 g of second batch). *This complexation is quite sensitive to scale and the purity of the palladium and phenanthroline these compounds were purchased from Acros and were used with no further purification. Yields were variable between different bottles of the same supplier. Hexane proved more efficient than pentane for the precipitation, but in some cases precipitation was not observed and couldn't be induced.*

A 5 mL round-bottomed test tube was charged with BphenPd(O₂CCF₃)₂ (**30**, 39.0 mg, 0.0590 mmol, 7.5 mol%). *n*Butyl vinyl ether (**9a**, 1.2 mL, 9.4 mmol, 12 equiv) was added, followed by benzyl phenethylcarbamate (0.200 g, 0.783 mmol, 1.0 equiv). The vial was sealed with a PTFE septum, which was then pierced with a needle (gauge 18 - "pink needle") in order to ensure exposure to air. The resulting brown-orange suspension was stirred at 80 °C for 3 hours. After this time, TLC analysis showed complete conversion of the starting material. The reaction mixture was then allowed to cool down to room temperature and was subsequently submitted to column chromatography (Biotage, 25 g SiO₂; EtOAc in pentane, 2 to 20% - 3 CV used to elute the butyl vinyl ether off). Pure benzyl phenethyl(vinyl)carbamate **1c** (0.160 g, 0.569 mmol, 73% yield) was obtained as a colorless oil.

DMAP (0.235 g, 1.93 mmol, 5 mol%) were added under nitrogen. The mixture, which rapidly became bright yellow, was then stirred at room temperature overnight. After 16 hours, it was concentrated under reduced pressure. The orange crude oil was then submitted to column chromatography (Biotage, 80 g SiO₂; EtOAc in pentane, 5 to 50%) to afford *tert*-butyl formyl(vinyl)carbamate (4.70 g, 27.5 mmol, 71% yield) as a yellow oil. The compound was used directly in next step, in a 100 mL one-necked, round-bottomed flask, *tert*-butyl formyl(vinyl)carbamate (4.60 g, 26.9 mmol, 1.0 equiv) was dissolved in THF (16 mL). The solution was cooled to 0 °C (ice water bath). Aq. NaOH (2.0 M; 16 mL, 32 mmol, 1.2 equiv) was added drop-wise, over a period of 20 minutes (syringe pump). Once the addition was complete, stirring was continued at 0 °C for another 15 minutes. The suspension was then allowed to warm to room temperature and stirred for additional 3 hours. Water (30 mL) was then added and the aqueous layer was extracted with MeOtBu (4 x 30 mL). The combined organic extracts were washed with water, brine, dried over Na₂SO₄, filtered, and concentrated under reduced pressure. The resulting crude solid was dissolved in pentane at room temperature (in order to reduce the volume of pentane, the dissolution was done under ultrasound irradiation). The solution was then allowed to stand at -20 °C (freezer) overnight. The precipitate was then collected by filtration and washed with a minimal amount of ice-cold pentane. *tert*-Butyl vinylcarbamate (**32**, 2.45 g, 17.1 mmol, 64% yield) was obtained as a crystalline, colorless solid.

Following a reported procedure,¹⁸ in a 100 mL, two-necked, round-bottomed flask, *tert*-butyl vinylcarbamate (**32**, 0.773 g, 5.40 mmol, 1.0 equiv) was dissolved in DMF (dry; 12.6 mL). The colorless solution was cooled to 0 °C (ice-water bath) and sodium hydride (60% dispersion in paraffin; 0.281 g, 7.02 mmol, 1.3 equiv) was added in single portion. Bubbling was immediately observed. The suspension was stirred at 0 °C for 30 minutes and at room temperature for another 30 minutes. The mixture looked, at this point, like a yellow-grey turbid solution. Benzyl bromide (0.84 mL, 7.0 mmol, 1.3 equiv) was then added drop-wise, followed by a catalytic amount of TBAI (tip of a spatula). The mixture was stirred at room temperature for 3 hours. After this time, full conversion of the starting material was observed based on TLC analysis (pentane:EtOAc 97:3). The reaction was quenched by cautious addition of water (12 mL), followed by sat. aq. NH₄Cl (12 mL). The aqueous layer was then extracted with ether (4 x 20 mL). The combined organic extracts were washed with water (30 mL), brine (2 x 30 mL), dried over MgSO₄, filtered, and concentrated under vacuum. The resulting yellow crude oil was submitted to column chromatography (Biotage, 40 g SiO₂; EtOAc in pentane, 0 to 7%) to provide *tert*-butyl benzyl(vinyl)carbamate **1d** (95% pure; 0.822 g, 3.35 mmol, 62% yield) as a yellow oil.

Tert-butyl methyl(vinyl)carbamate (**1e**)

Following a reported procedure,²⁰ A 100 mL, two-necked, round-bottomed flask was charged with NaH (60% w/w dispersion in mineral oil; 0.192 g, 4.80 mmol, 1.2 equiv). The flask was evacuated, and backfilled with nitrogen (3 times). THF (dry; 30 mL) was then added. The resulting suspension was cooled to 0 °C (ice - water bath) and a solution of *t*-butyl N-vinyl carbamate (**32**, 0.572 g, 4.00 mmol, 1.0 equiv) in THF (dry; 10 mL) was added slowly, by syringe at the same temperature. Immediately, moderate gas bubbling was observed. The resulting pale yellow mixture was stirred at 0 °C for 30 minutes. Methyl iodide (0.39 mL, 6.4 mmol, 1.6 equiv) was then added. The cooling bath was removed and stirring was continued under Ar (balloon) overnight. The reaction was then quenched by addition of sat. aq. NH₄Cl (30 mL). The aqueous layer was separated and extracted with EtOAc (3 x 30 mL). The combined organic layers were washed with brine, dried over MgSO₄, filtered, and concentrated under reduced pressure. The resulting crude oil was submitted to column chromatography (SiO₂; EtOAc:pentane 0:100 to 25 / 75) to give *tert*-butyl N-methyl N-vinyl carbamate (**1d**, 0.282 g, 1.70 mmol, 45% yield) as a colorless oil.

Tert-butyl (2-*tert*-butyldimethylsilyl)oxyethyl)(vinyl)carbamate (**1g**)

Under standard silylating conditions: in a 50 mL single-necked, round bottomed flask, a solution of *tert*-butyldimethylchlorosilane (2.41, 16.0 mmol, 1.5 equiv) in dichloromethane (7.0 mL) was added drop-wise over a period of 3 min to a stirred solution of ethanolamine (**34**, 0.80 mL, 13 mmol, 1.0 equiv) and imidazole (1.36 g, 20.0 mmol, 1.5 equiv) in dichloromethane (14 mL) at room temperature. The resulting mixture initially looked like a milky solution that became clear and colorless after being stirred at room temperature for 1 hour. Water (20 mL) was then added, and the layers were separated. The aqueous layer was extracted with dichloromethane (2 x 20 mL), and the combined organic extracts were dried over MgSO₄, filtered and concentrated *in vacuo* to give 2-((*tert*-butyldimethylsilyl)oxy)ethanamine (**35**, 2.05 g, 11.7 mmol, 88% yield) as pale yellow oil, which was used directly in next step with no further analysis.

The mixture was stirred at 0 ° for 45 minutes, and then at room temperature for additional 45 minutes. The solids were then removed through rapid filtration. CH₂Cl₂ was then distilled off (rotary evaporator) to give a red crude imine. To the crude imine was added a solution of di-*tert*-butyl dicarbonate (2.40 g, 11.0 mmol, 1.1 equiv) in toluene (dry; 5.0 mL), followed by triethylamine (1.5 mL, 11 mmol, 1.1 equiv). The resulting orange suspension was stirred at 80 °C for 5 hours, slowly becoming a dark orange solution. The reaction was stopped and the volatiles were removed under reduced pressure. The resulting crude yellow-orange oil was submitted to column chromatography (SiO₂; Pentane:Et₂O 248:2 to 24:1). The desired product was obtained as a mixture with unreacted Boc₂O. The excess Boc₂O was removed as following: the eluate was dissolved in EtOH (5 mL) and imidazole (300 mg) and DMAP (54.0 mg, 0.1 eq compared to imidazole) were added. The resulting mixture was stirred at room temperature for 10 minutes. It was then concentrated under reduced pressure. Following an adapted reported procedure,²³ a 5 mL round-bottomed test tube was charged with (dpp)Pd(O₂CCF₃)₂ (31.0 mg, 0.0460 mmol, 5 mol%). Butyl vinyl ether (1.5 mL, 11 mmol, 12 equiv) was added, followed by ethyl 3-((*tert*-butoxycarbonyl)amino)propanoate (0.200 g, 0.921 mmol, 1.0 equiv). The vial was sealed with a PTFE septum, which was then pierced with a needle (gauge 18 - "pink needle") in order to ensure exposure to air. The resulting brown-orange suspension was stirred at 80 °C for 2 hours. After this time, the mixture looked like a clear orange solution. According to TLC analysis, the starting material was still present after this time, with no further progress upon stirring the mixture at the same temperature for additional 60 minutes. A further amount of catalyst (16.0 mg, 0.0260 mmol, 2.5 mol%; overall 7.5 mol%) was therefore added and stirring was continued at 80 °C for 2 hours. The reaction mixture was then allowed to cool down to room temperature and was subsequently submitted to column chromatography (Biotage, 25 g SiO₂; EtOAc in pentane, 2 to 20%).¹⁵ Pure ethyl 3-((*tert*-butoxycarbonyl)(vinyl)amino)propanoate **1h** (0.121 g, 0.499 mmol, 54% yield) was obtained as a colorless oil.

Following a modified reported procedure,²⁴ in sealed 20 mL, round-bottomed vial, 1-hexyne (**39**, 0.70 mL, 5.9 mmol, 1.0 equiv) and catecholborane (0.77 mL, 7.1 mmol, 1.20 equiv) were dissolved in THF (dry; 19 mL) and the mixture was stirred under reflux for 18 hours. After this time, the pale yellow solution was allowed to cool down to room temperature, transferred into a 25 mL, round bottomed flask and concentrated under reduced pressure. Water (0.8 mL) was added to the residue, with immediate formation of a colorless solid. The suspension was vigorously stirred for 4 hours at room temperature. The solid was collected by filtration and washed with water. (*E*)-Hex-1-en-1-ylboronic acid (0.469 g, 3.66 mmol, 62% yield) was obtained as a colorless solid, which was directly submitted to the following step.

Following a reported procedure,²⁵ in a 25 mL, round bottomed flask, (*E*)-hex-1-en-1-ylboronic acid (0.469 g, 3.66 mmol, 1.0 equiv) was dissolved in the minimal volume of MeOH (1.2 mL). A solution of KHF₂ (1.00 g, 12.8 mmol, 3.5 equiv) in water (2.9 mL; 4.5 M) was added slowly, causing the rapid precipitation of a colorless solid. The suspension was stirred at room temperature for 15 minutes. The solid (potassium (*E*)-trifluoro(hex-1-en-1-yl)borate (**40**, 0.244 g, 1.28 mmol, 35% yield) was then collected by filtration and dried under vacuum.

Optimisation of the reaction conditions and control reactions:

An oven-dried screw-top vial was charged with PC (5 μmol , 5 mol%), PhEBX (**2**, 0.10 mmol, 1.0 equiv) and additive (X equiv). After 3 vacuum/ N_2 cycles, dry degassed (*via* freeze-pump-thaw technique) solvent was added (1.1 mL, 0.097 M; unless specified) followed by **1a** (1.2 equiv). The reaction was sealed under a flow of Argon and the reaction vessel was placed under irradiation (blue leds) and stirred overnight (18 hours). After this time, the conversion of PhEBX could be observed by TLC analysis (Pent:EtOAc, 7:3, p-anisaldehyde stain, blue-green spot). The reaction mixture was concentrated under reduced pressure. CH_2Br_2 (7 μL , 1.0 equiv) were added as an internal standard and the crude was solubilised immediately in Chloroform-*d*.

Electrochemical experiments

An Autolab potentiostat with a 3 electrode cell configuration: glassy carbon (working electrode), Pt wire as (control electrode), and Ag/AgCl (KCl, 3M aq.) as (reference electrode) was used for the measures. Tetrabutyl ammonium hexafluorophosphate (TBAP, 0.1M in MeCN) was used as an electrolyte. The sample (0.01 mmol) was dissolved in a stock solution of TBAP (0.1 M, 10 mL in MeCN) and was degassed by bubbling Argon directly before measure. The redox couple $E(\text{alkene}^{+\bullet}/\text{alkene})$ is defined as the potential E measured for $\frac{I_{\max}}{2}$.

Stern Volmer quenching experiments

Stern-Volmer fluorescence quenching experiments were conducted on a Varian Cary Eclipse machine.

A degassed stock solution of 48 μM of photocatalyst **4b** in DCM was prepared. 0.5 mL of this solution was placed in a 0.5 mL fluorimeter cuvette. Progressively, the quencher **1a** or **1k** was added via Hamilton syringe in portions of 5 μL or 10 μL between each addition the fluorescence spectra was measured.

The emission intensity was recorded at 527 nm.

Important note: Pre-prepared stock solutions of quencher and photocatalyst gave poorly reproducible results, it was found that the fluorescence spectra were the most reproducible when adding pure **1a** or **1k**, for this reason (in addition to the poor solubility of BIOAc) the fluorescence quenching spectra for **7** were not measured. The concentrations for the Stern-Volmer plots were calculated based on approximate volumetric masses of **1a** and **1k** at RT and ambient pressure. 40 μL of **1a** weigh 49 μg at RT and ambient pressure. Approximated volumetric mass was estimated to be 1.2 g/mL. 40 μL of **1k** weigh 42 μg Approximated volumetric mass was estimated to be 1.1 g/mL.

Graph S4. Fluorescence emission spectra of **4b**: fluorescence quenching by **1a**.

Graph S5. Fluorescence emission spectra of **4b**: fluorescence quenching by **1k**.

Graph 6. Stern-Volmer plot for **1a** and **1k**.

Interestingly **1k** also quenches the photocatalyst however the process is non-productive (no conv. with **1k**).

Experimental set-up

A : Overtop ventilation, B : crystallisation bowl wrapped with LEDs. C flask stuck to bottom of crystallisation bowl ca. 3 cm away from LEDs. The whole set up is concealed from the external light sources with a reflective shield.

General procedure for scope scale reactions:

An oven-dried flat-bottomed screw-cap vial equipped with a magnetic stirrer was charged with R-EBX (0.25 mmol, 1.0 equiv), BIOAc (0.13 mmol, 0.5 equiv) and 4-ClCzIPN (**4b**, 5 mg, 5 μ mol, 2 mol%). The reaction vessel was sealed with a rubber septum. Following three vacuum/nitrogen cycles, dry, degassed (*via* freeze-pump-thaw technique) CH₂Cl₂ (0.25 M based on R-EBX, 1.0 mL) was then added. The substrate (0.38 mmol, 1.5 equiv)²⁹ was then added *via* syringe. The rubber septum was replaced with the corresponding screw-cap under a flux of Argon. The reaction was irradiated overnight (15 h-18 h) with blue LED strips under ventilation (T = 25°C) and stirring. The volatiles were evaporated off. The crude was then dissolved in CH₂Cl₂ with 0.2 mL of Et₃N. A solid deposit for flash chromatography was prepared with SiO₂ (ca. 3g). The crude was then purified through flash chromatography (Et₃N deactivated SiO₂ ca. 40 g or biotage : SiO₂ 25 g, Pentane:Et₂O or Pentane:EtOAc)³⁰ affording the desired difunctionalised product.

Sunlight experiment

An oven-dried flat-bottomed 2 mL screw-cap vial equipped with a magnetic stirrer was charged with Ph-EBX (**2**, 0.087 g, 0.25 mmol, 1.0 equiv), BIOAc (**7**, 0.038 g, 0.13 mmol, 0.5 equiv) and 4-ClCzIPN (**4b**, 5 mg, 5 μ mol, 2 mol%). The reaction vessel was sealed with a rubber septum. Following three vacuum/nitrogen cycles, the vial was refilled with argon. Then, dry, degassed (*via* freeze-pump-thaw technique) CH₂Cl₂ (10.0 mL, 0.29 M) was added. Benzyl phenethyl(vinyl) carbamate (**1c**, 0.106 g, 0.375 mmol, 1.5 equiv) was then added *via* syringe. The reaction was placed in direct sunlight for 5 h under stirring then 4 h without stirring. A deactivated solid deposit for flash chromatography was prepared: a slurry of SiO₂ (ca. 3 g) and ca. 0.2 mL of Et₃N was prepared and then combined with the crude reaction mixture before concentration. The crude was then purified through flash chromatography (biotage: SiO₂ 25 g, Pentane:EtOAc 0% to 15%) affording **3c** (0.107 g, 0.170 mmol, 68% yield).

Weather report:³² sunny with partial clouds temperature from 23-30 °C.

Gram scale

An oven-dried flat-bottomed 10 mL snap-cap vial equipped with a magnetic stirrer was charged with Ph-EBX (**2**, 1.00 g, 2.87 mmol, 1.0 equiv), BIOAc (**7**, 0.440 g, 2.87 mmol, 0.5 equiv) and 4-ClCzIPN (**4b**, 61 mg, 57 μ mol, 2 mol%). The reaction vessel was sealed with a rubber septum. Following three vacuum/nitrogen cycles, the vial was refilled with argon. Then, dry, degassed (*via* freeze-pump-thaw technique) CH₂Cl₂ (10.0 mL, 0.29 M) was added. *N*-vinyl pyrrolidinone (**1i**, 0.46 mL, 4.3 mmol, 1.5 equiv) was then added *via* syringe. The reaction was irradiated overnight (18 h) with blue LED strips under ventilation (T = ca. 25°C) and stirring. A deactivated solid deposit for flash chromatography was prepared: a slurry of SiO₂ (ca. 20 g) and ca. 1 mL of Et₃N was prepared and then combined with the crude reaction mixture before concentration. The crude was then purified through flash chromatography (biotage : SiO₂ 120 g, Pentane:EtOAc 20% to 50%) affording **3i** (0.998 g, 1.83 mmol, 64% yield).

2-(Phenethylamino)-4-phenylbut-3-yn-1-yl 2-iodobenzoate (**16**)

To a 5 mL vial equipped with a magnetic stirrer, **3b** (0.047 g, 0.078 mmol, 1 equiv) were dissolved in CH₂Cl₂ (0.8 mL), trifluoroacetic acid (130 μL, 1.90 mmol, 25 equiv) was added dropwise at room temperature. The reaction was stirred for 1h 30 min. At this time, TLC showed full conversion of **3b**. TFA and CH₂Cl₂ were evaporated off. The crude was diluted with Et₂O (1 mL) and basified with Na₂CO₃ aq. sat. (0.5 mL) until pH > 11. The aqueous layer was extracted a second time with Et₂O (1.5 mL). The combined organic layers were combined, dried over MgSO₄, then passed through a short plug of deactivated silica. The plug was then washed through with EtOAc. Upon concentration pure **15** was obtained as a colorless oil (0.029 g, 0.059, 74% yield).
