## General Methods

CuCl, KOtBu, pinacolborane, and other commercial reagents were purchased from Aldrich and used as received. (*R*)-DTBM-Segphos (**L6**) was purchased from TCI. **1a–1r** were prepared by following literature procedures.<sup>1</sup> Reactions with oxygen- and moisture-sensitive materials were carried out with the standard Schlenk technique. Toluene was purified using PureSolv solvent purification system, from Innovative Technology, Inc. Flash chromatography was performed on silica gel from Merck (70–230 mesh). All <sup>1</sup>H NMR spectra were obtained on Bruker at 500 systems and reported in parts per million (ppm) downfield from tetramethylsilane. <sup>13</sup>C NMR spectra are reported in ppm referenced to deuteriochloroform (77.16 ppm). Infrared spectra (IR) were obtained on Nicolet 205 FT-IR and were recorded in cm<sup>-1</sup>. Optical rotation was measured with Model 343 plus polarimeter equipped with a sodium lamp (589 nm). High performance liquid chromatography (HPLC) was performed using Younglin Acme 9100 series. High resolution mass spectra (HRMS) were obtained at Korea Basic Science Institute (Cheongju, Korea) and reported in the form of *m/z* (intensity relative to peak = 100).

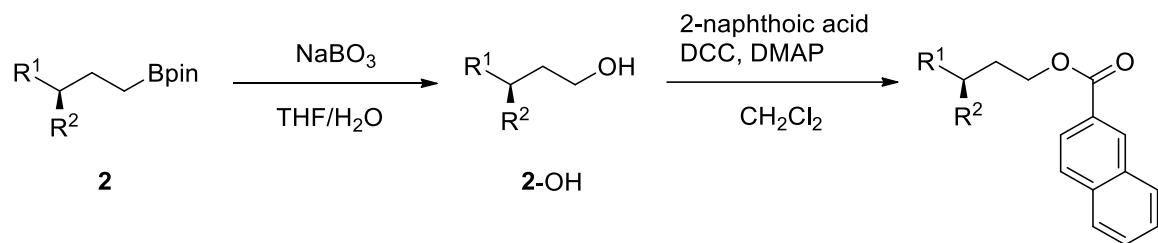

## General procedure for the remote hydroboration of $\gamma,\gamma$ -disubstituted allylic substrates

LG = OAc or OBz

A mixture of CuCl (5 mol %, 0.025 mmol), (*R*)-DTBM-Segphos (5.5 mol %, 0.0275 mmol) and KOtBu (1 mmol) in anhydrous toluene (2 mL) were stirred for 5 min in a Schlenk tube under an atmosphere of nitrogen. Pinacolborane (1.5 mmol) was added to the reaction mixture and stirred for another 15 min at room temperature. Substrate **1** dissolved in toluene (1 mL) was added. The reaction mixture was sealed, stirred at 60 °C, and monitored by TLC. Upon completion of the reaction, the reaction mixture was diluted with diethyl ether (10 mL). After the aqueous layer was extracted with diethyl ether, the combined organic layers were dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated in vacuo. The product was purified by silica gel chromatography using hexanes/ethyl acetate as the eluent.

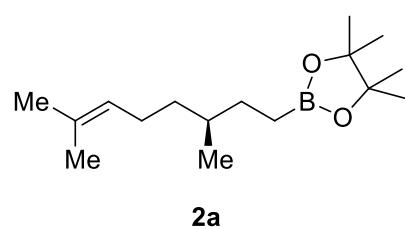

## Determination of ee

Sodium perborate (0.9 mmol) was added to **2** (0.3 mmol) in THF (2 mL) and water (2 mL). The reaction mixture was vigorously stirred for 4 h at room temperature. The reaction was quenched with water and then, extracted with diethyl ether. The combined organic layers were dried over  $\text{Na}_2\text{SO}_4$  and concentrated in vacuo. The product was purified by silica gel chromatography.

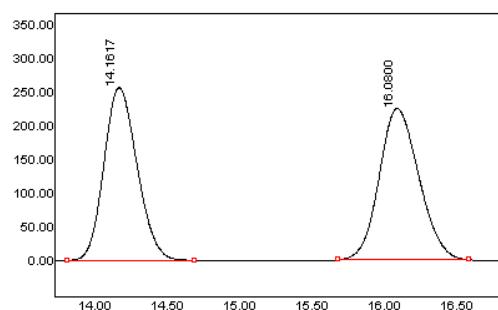

To **2-OH** (1 equiv) in  $\text{CH}_2\text{Cl}_2$  (3 mL) were added dicyclohexylcarbodiimide (1.05 equiv), 4-(dimethylamino)pyridine (0.25 equiv) and 2-naphthoic acid (1 equiv). The reaction mixture was stirred at room temperature and monitored by TLC. Upon completion of the reaction, the reaction mixture was purified silica gel chromatography.

## Characterization of **2** (Table 1 and 2)

## Hydrolysis of Allylic Acetate

The reaction of **1m**-OAc under the standard reaction conditions afforded the corresponding allylic alcohol product by hydrolysis. Proposed mechanism of hydrolysis of **1m**-OAc to generate an allylic alcohol is shown in Scheme S1-b. Moreover, no hydrolysis occurred absence of KOtBu base (Scheme S1-c). This result indicates that KOtBu base leads to hydrolysis of the starting allylic acetate.
