## 1. Characterizations

<sup>1</sup>H and <sup>13</sup>C NMR spectra were measured with the deuterated solvents (CDCl<sub>3</sub> and DMSO-d6) and employed the tetramethyl silane (TMS) as an internal standard (Bruker AM-400 MHz NMR spectrometer). The obtained samples were prepared by dispersing in KBr powder and the corresponding FT-IR spectra were measured in the 4000-400 cm<sup>-1</sup> region (VARIAN 1000 FT-IR spectrometer). The solid-state <sup>13</sup>C/NMR spectra of the polymers were carried out by using an Avance III HD 400 NMR spectrometer. Surface areas were measured by nitrogen adsorption and desorption at 77 K using Micromeritics ASAP 2020M. The pore-size-distribution of the polymers were acquired by the adsorption branches (non-local density functional theory method, NLDFT). The polymers surface morphologies were carried out at an accelerating voltage of 8.0 kV (FEI SIRION200). The UV-Vis adsorption spectra of the powders in the solid state were obtained on a scan UV-Vis spectrophotometer (U-4100 spectrometer). The electrochemical impedance spectra (EIS) was performed on an electrochemical workstation at room temperature in the dark (CHI760E). The photocurrent of the polymer was performed on a VersaSTAT 3 electrochemical workstation under irradiation of 300 W Xe lamp. The fluorescence spectra were characterized by using excitation wavelength of 365 nm at room temperature (F97PRO fluorescence spectrometer). The time-correlated fluorescence spectroscopy of solid samples was performed on a FLS-980 fluorescence lifetime spectrometer. The cyclic voltammetry (CV) measurements were carried out on an electrochemical workstation system in a 0.1 M Bu<sub>4</sub>NPF<sub>6</sub> solution (0.1 V/s, CHI660E). The density functional theory (DFT) calculations was applied to optimize the geometry of monomers and oligomers (B3LYP functional, and 6-31G(d) basis set). The time-dependent density functional theory (TD-DFT) was utilized to calculated electronic transitions of the monomers (CAM-B3LYP functional, and 6-31G(d) basis set). The molecular configuration optimization and electrostatic potential map was carried out by DFT calculations (Gaussian 09 software package and Gauss View visualization program). The transition density matrix (TDM) heat map of electron and hole contribution of excited monomer fragments were constructed by the Multiwfn 3.6 program. The optimal configuration and natural dipole moment of monomers are visualized by the VMD 1.9.3 program.

## 2. Synthesis and Characterization of Monomers and Polymers

**Scheme 1.** The synthetic route of monomers and polymers.

### **Synthesis of 9,9'-(benzene)-bis(9H-carbazole) (BzDCz)**

A mixture of 1,4-dibromobenzene (3 g, 10.6 mmol), potassium carbonate (5.3 g, 38.2 mmol), copper iodide (200 mg, 1.1 mmol), 1,10-phenanthroline (190 mg, 1.1 mmol), carbazole (6.4 g, 38.2 mmol) in dry N, N-dimethylformamide (80 mL) was stirred for 24 hours at 140 °C under N<sub>2</sub>. After cooling to room temperature, the reaction mixture was concentrated to remove the solvent. The residue was purified by flash column chromatography to remove the byproduct, and the resulting mixture was suspended in dichloromethane (20 mL) and stirred for one hour. The filtrate was concentrated and performed for two times following the above steps. The desired product was obtained as a white solid in 66 % yield.  
<sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 8.23–8.21 (d, 4H), 7.84 (s, 4H), 7.61–7.59 (d, 4H), 7.53–7.50 (t, 4H), 7.39–7.36 (t, 3H). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>): δ 140.79, 136.70, 128.40, 126.16, 123.60, 120.48, 120.31, 109.78.

### **Synthesis of 9, 9'-{Pyridine-2, 5-diyl} bis(9H-carbazole) (PyDCz)<sup>1</sup>**

The mixture of 2,5-dibromopyridine (3 g, 12.8 mmol), 9H-carbazole (6.5 g, 38.9 mmol), copper power (1.12 g, 11.3 mmol) and potassium carbonate (15.7 g, 113 mmol) in 40 mL nitrobenzene was stirred for 48 hours at 180 °C. After cooling to room temperature, the reaction mixture was extracted with dichloromethane for three times (3×50 mL). The organic phase was separated and concentrated under reduced pressure. The crude solid product was further purified by column chromatography on silica gel with PE/DCM (v/v = 2/1) as the eluent to afford a white solid in 90% yield. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): δ 8.99 (d, J = 2.6 Hz, 1H), 8.32–8.10 (m, 5H), 8.03 (d, J = 8.3 Hz, 2H), 7.92 (d, J = 8.5 Hz, 1H), 7.61–7.44 (m, 6H), 7.44–7.33 (m, 4H). <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>, ppm): δ 150.55, 148.01, 140.73, 139.45, 136.84, 131.83, 126.43, 126.40, 124.59, 123.79, 121.38, 120.72, 120.62, 120.35, 119.35, 111.34, 109.39.

### **Synthesis of 9, 9'-{Pyrimidine-2, 5-diyl} bis(9H-carbazole) (PymDCz)**

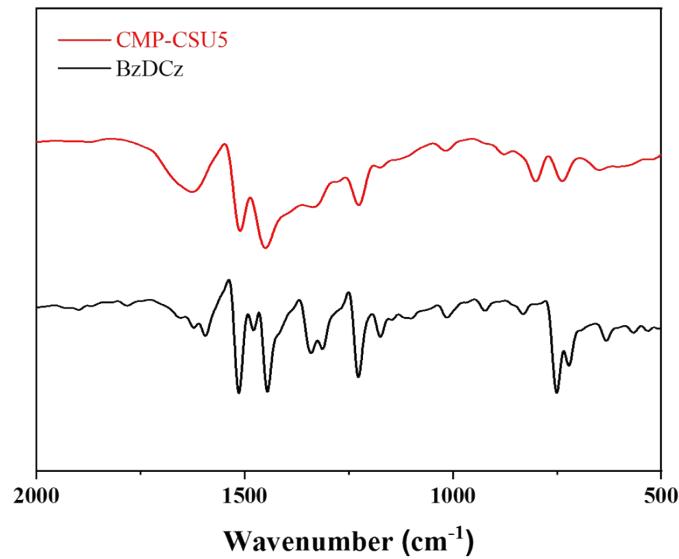

PymDCz (yield: 85%) was prepared under the identical synthetic conditions described in the preparation of PyDCz using 2,5-dibromopyrimidine (3 g, 12.7 mmol), 9H-carbazole (6.5 g, 38.9 mmol), copper power (1.12 g, 11.3 mmol) and potassium carbonate (15.7 g, 113 mmol). <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>, ppm): δ 9.08 (s, 2H), 8.99 (d, J = 8.4 Hz, 2H), 8.20 (d, J = 7.8 Hz, 2H), 8.12 (d, J = 7.1 Hz, 2H), 7.61–

7.34 (m, 10H).  $^{13}\text{C}$  NMR (100 MHz,  $\text{CDCl}_3$ ):  $\delta$  157.61, 156.48, 140.81, 139.14, 127.77, 126.87, 126.55, 126.12, 123.86, 122.83, 120.94, 120.72, 119.67, 116.64, 109.13.

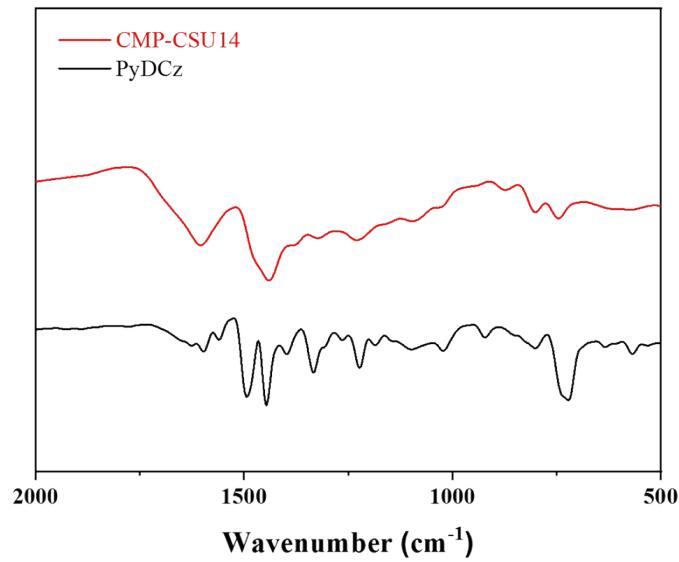

***Recycle experiments based on CMP-CSU14***

1-H Indole (0.2 mmol), KSeCN (0.4 mmol, 2 equiv), tetrahydrofuran (2 mL) and CMP-CSU14 (10 mg) were transferred to a transparent reaction tube. The reaction mixture was degassed and protected with an  $\text{O}_2$  balloon ( $\sim 0.1 \text{ MPa}$ ) and then stirred under irradiation with the light source (a 14 W blue LED,  $0.20 \text{ W/cm}^2$ , distance app.8 cm) for 24 hours. After each cycle was completed, the photocatalyst (CMP-CSU14) was gathered by centrifugation, washed with tetrahydrofuran and water repeatedly to remove products and unreacted substrates, dried at  $100^\circ\text{C}$  in vacuum for 12 hours. After that, the collected CMP-CSU14 was re-applied for next cycle.

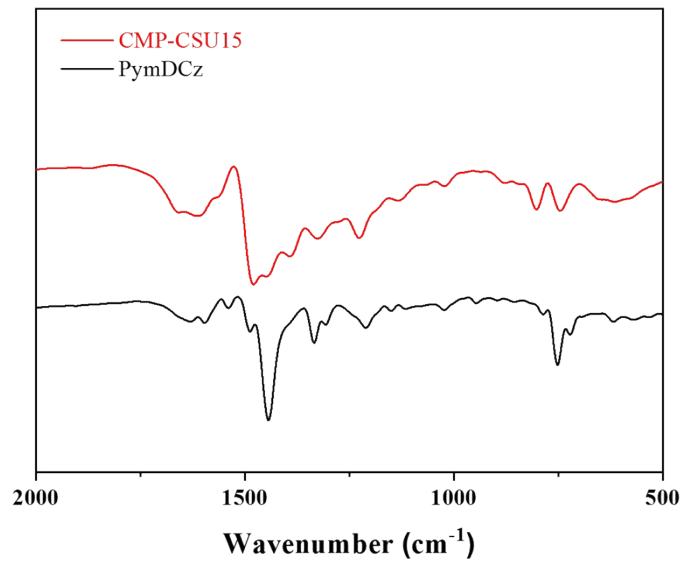

### 3. Photocatalyst Characterizations

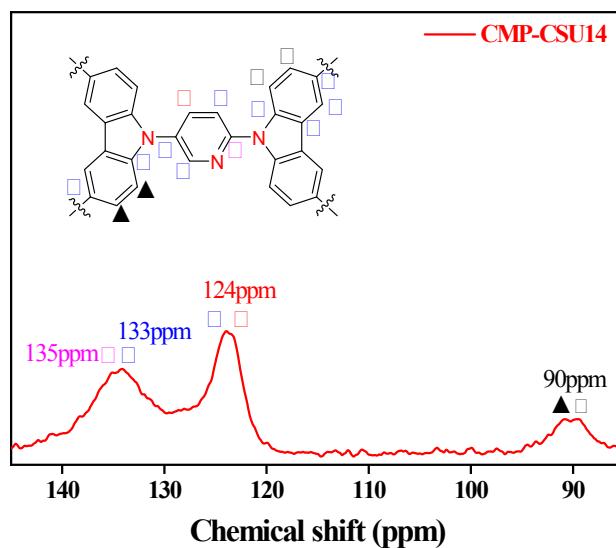

**Fig. S1** Partial FT-IR spectra of BzDCz and CMP-CSU5.

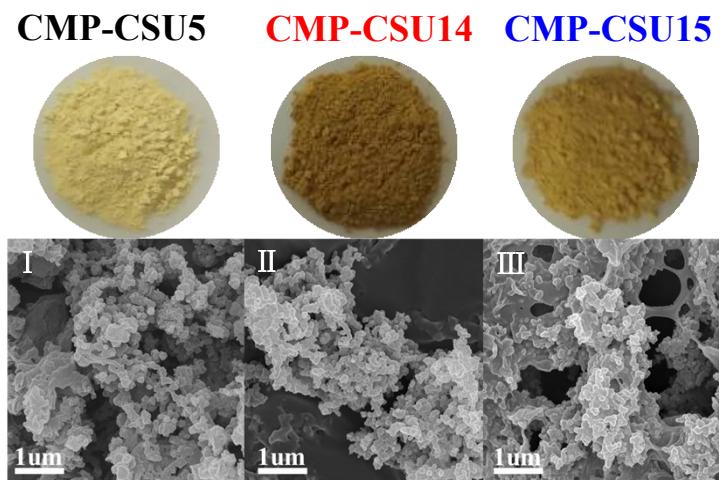

**Fig. S2** Partial FT-IR spectra of PyDCz and CMP-CSU14.

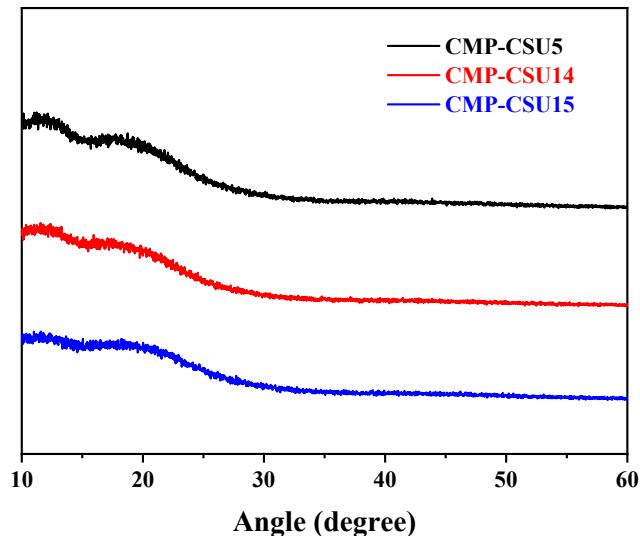

**Fig. S3** Partial FT-IR spectra of PymDCz and CMP-CSU15.

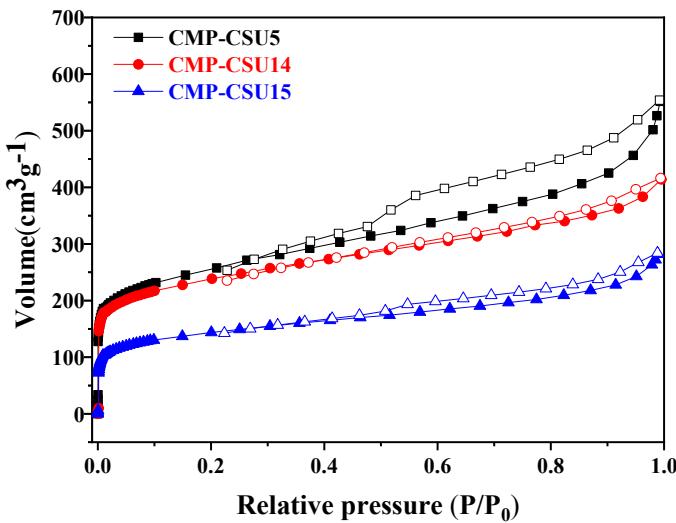

**Fig. S4** Solid-state  $^{13}\text{C}$  CP-MAS NMR spectrum of CMP-CSU14.

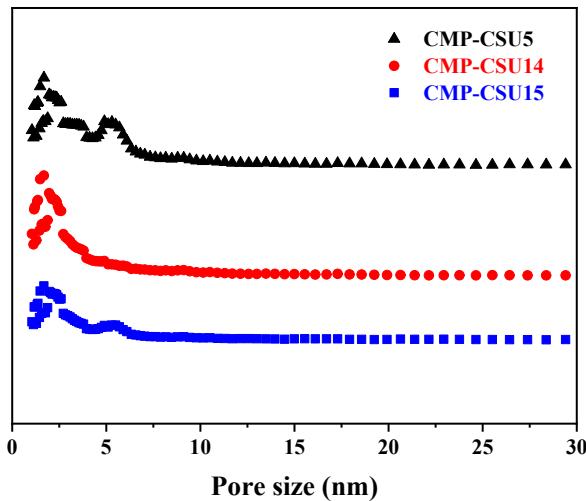

**Fig. S5** Photograph and scanning electron microscopy (SEM) image of (I) CMP-CSU5, (II) CMP-CSU14, and (III) CMP-CSU15.

**Fig. S6** Powder XRD analysis of CMP-CSU5, CMP-CSU14, and CMP-CSU15.

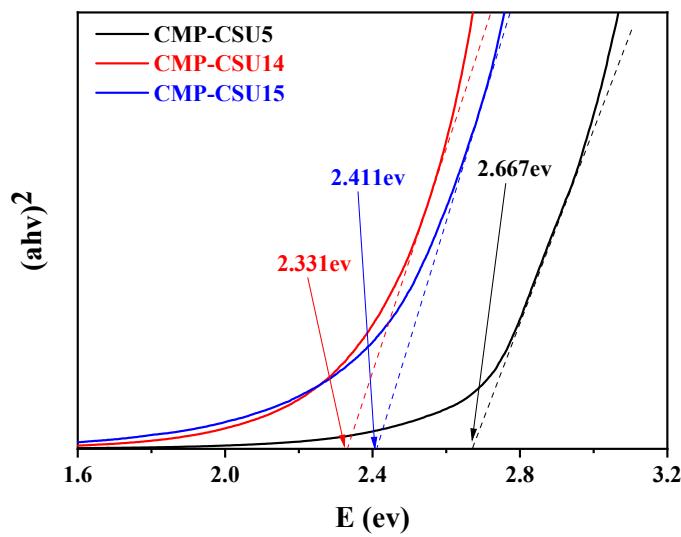

**Fig. S7** Nitrogen adsorption (solid circle) and desorption (open circle) isotherm of CMP-CSU5, CMP-CSU14 and CMP-CSU15 at 77 K.

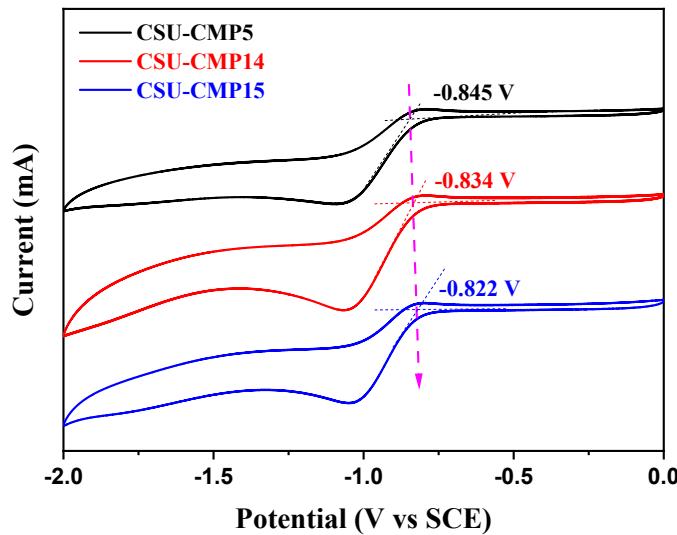

**Fig. S8** Pore size distribution of CMP-CSU5, CMP-CSU14, CMP-CSU15.

**Table S1.** Porosity data of CMP-CSU5, CMP-CSU14, CMP-CSU15.

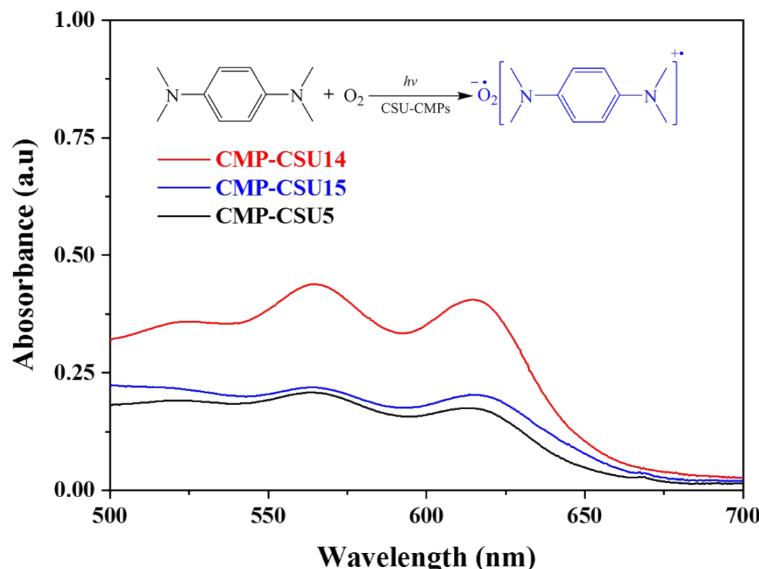

Samples	$S_{\text{BET}}$ ( $\text{m}^2 \text{ g}^{-1}$ )	$V_{\text{total}}$ ( $\text{cm}^3 \text{ g}^{-1}$ )	$V_{\text{meso}}/V_{\text{total}} (\%)$
CMP-CSU5	912.3	0.79	87%
CMP-CSU14	867.3	0.59	71%
CMP-CSU15	528.6	0.39	75%

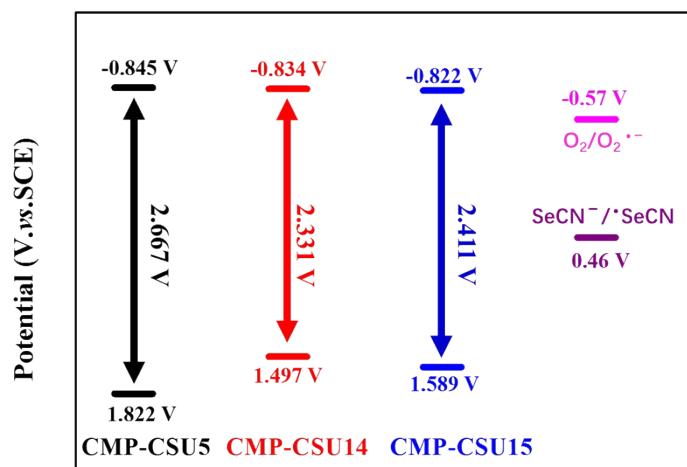

**Fig. S9** Tauc plots of the transformed Kubelka-Munk function of CMP-CSUs.

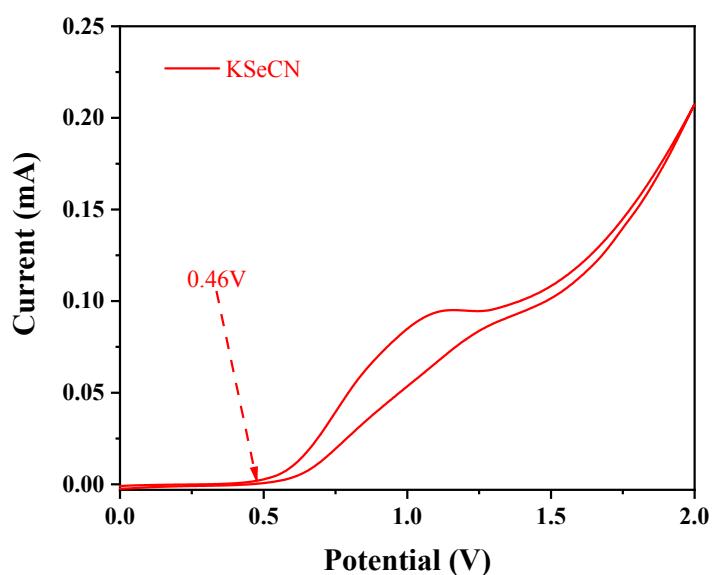

**Fig. S10** Cyclic voltammetry curves of CMP-CSUs in deaerated  $\text{CH}_3\text{CN}$  with  $0.1 \text{ M } \text{Bu}_4\text{PF}_6$  as supporting electrolyte with scan rate of  $0.1 \text{ V/s}$ .

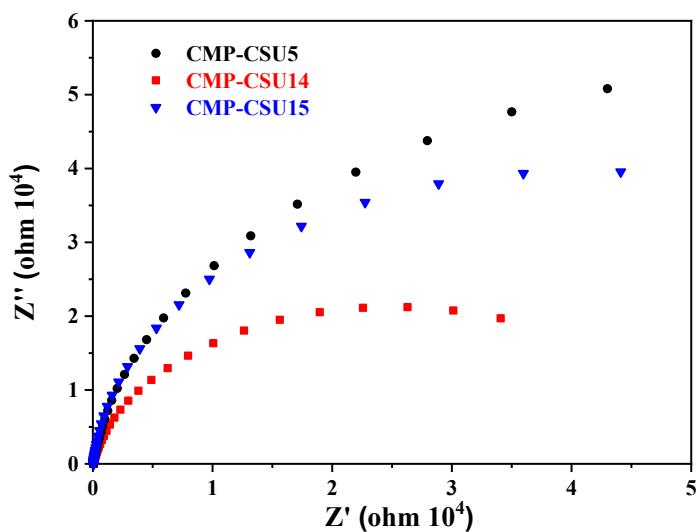

**Fig. S11** UV-vis absorption spectra and photograph of the cationic radical of TMPD generated by CMP-CSUs in the presence of light and oxygen.

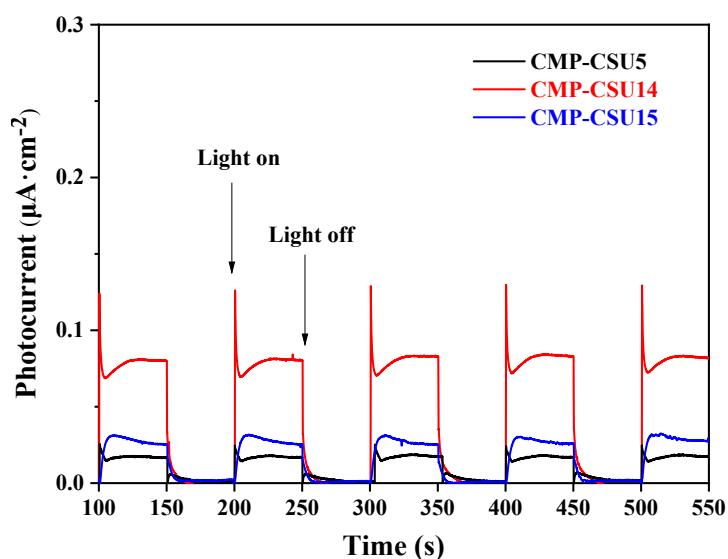

**Fig. S12** LUMO and HOMO positions of CMP-CSUs.

**Fig. S13** Cyclic voltammetry of potassium selenocyanate (KSeCN) with a scan rate of 0.01 V/s.

**Fig. S14** Electrochemical impedance spectroscopy (EIS) Nyquist plots of CMP-CSUs.

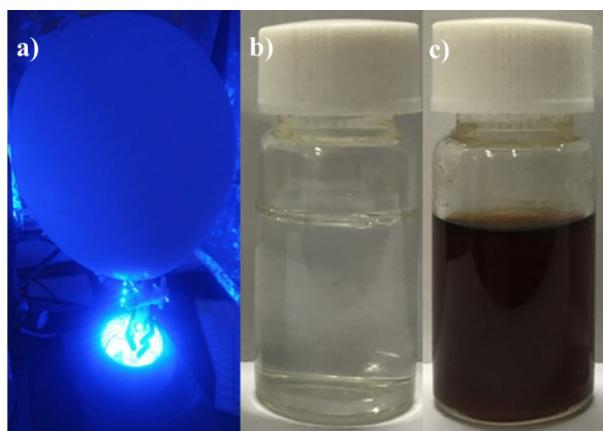

**Fig. S15** Transient photocurrent of CMP-CSUs.

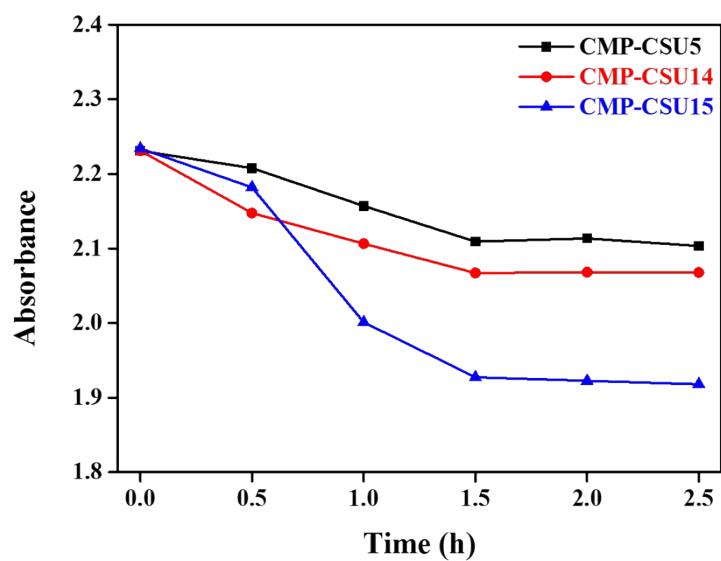

**Table S2.** Fitted decay time of CMP-CSUs.

Photocatalyst	$\tau_1$ (ns)	$\tau_2$ (ns)	average time (ns)
CMP-CSU5	0.50	2.11	0.70
CMP-CSU14	0.55	4.76	2.56
CMP-CSU15	0.39	3.95	2.46

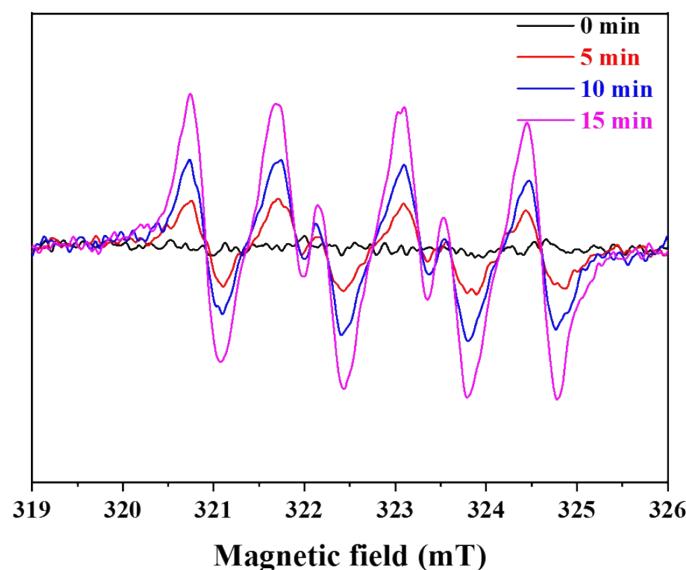

$\tau_1$  can be attributed to the radiative recombination of the photogenerated charge carriers, and the  $\tau_2$  mainly represent the lifetimes of nonradiative and energy transfer process;  $A_1$  and  $A_2$  are the pre-exponential factors of decay curves.

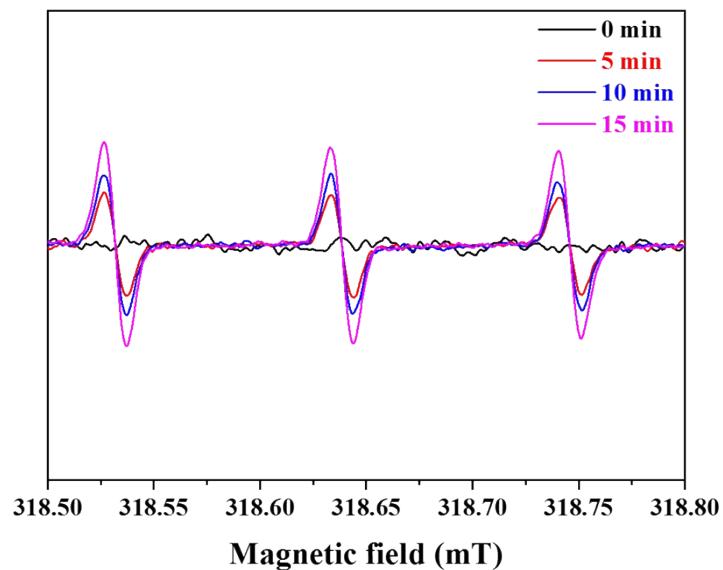

**Fig. S16** (a) Photograph of C-3 Selenocyanation of indoles based on CMP-CSU14 under UV light; photograph of reaction mixture (b) before reaction (c) after reaction under UV light for 24 hours.

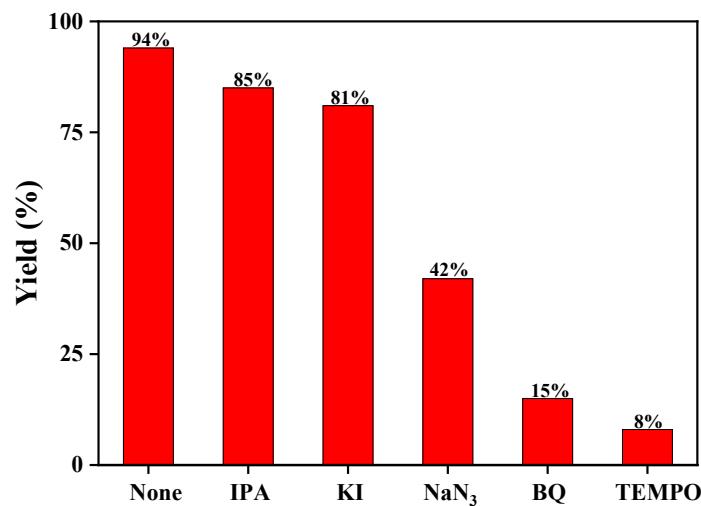

**Fig. S17** Adsorption behavior of CMP-CSUs towards 1-H Indole in dark condition.

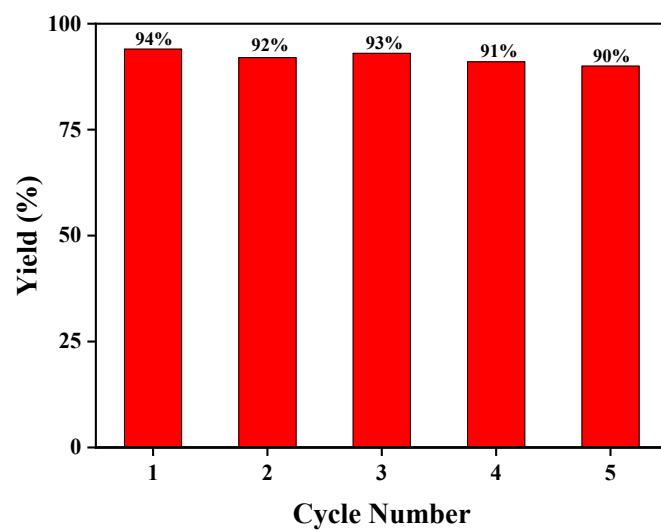

**Fig. S18** EPR spectra of a mixture of CMP-CSU14 and DMPO upon light irradiation for 15 minutes (pink line), 10 minutes (blue line), 5 minutes (red line) and 0 minutes in the dark (black line).

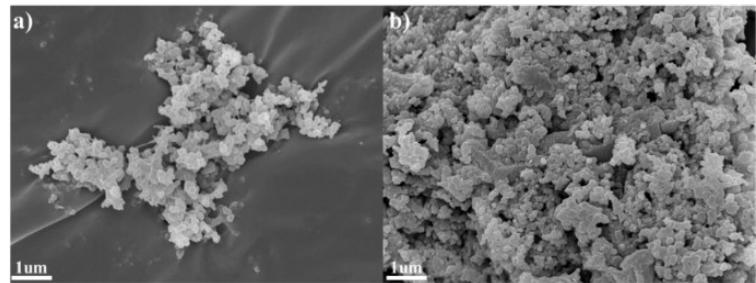

**Fig. S19** EPR spectra of a mixture of CMP-CSU14 and TEMP upon light irradiation for 15 minutes (pink line), 10 minutes (blue line), 5 minutes (red line) and 0 minutes in the dark (black line).

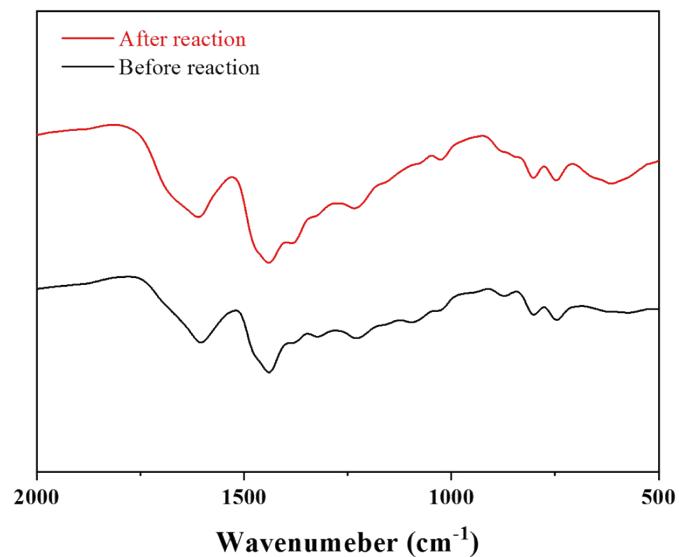

**Fig. S20** Control experiments for the C-3 selenocyanation of indoles.

**Fig. S21** Recycled performance of the CMP-CSU14 for the C-3 selenocyanation of indoles.
