1. Synthetic procedure for the synthesis of perylene-based aromatic polyimide (PI) through polymerization of perylene-3,4:9,10-tetracarboxylic acid (PTCDA) units with 2,6-diaminoanthraquinone (2,6-DAAQ) in a single condensation reaction step (as shown in Scheme 1).

The mixture of PTCDA units (2 g, 5.1 mmol) and 50 g of imidazole was heated and stirring at 150 °C under a nitrogen atmosphere for the complete dissolution of the starting material. Subsequently, 2,6-DAAQ (1.2 g, 5.04 mmol) was added gradually (portion-wise) to this mixture at 150 °C. The reaction mixture was gradually heated to 165–170 °C and maintained at the same temperature for 24 h. Subsequently, it was cooled to 60 °C, and methanol (100 mL) was added into the reaction mixture under stirring to precipitate the product. The black precipitate was collected through vacuum filtration and was washed with DMF (2×50 mL) and ethanol (2×100 mL). The final product was collected as a black powder (2.9 g, 95.7%). The decomposition temperature based on 5% weight loss by TGA was 286 °C; FT-IR (KBr): v = 1698 (s), 1663 (s), 1587 (s), 1571 (s), 1340 (br), 737 cm⁻¹ (br). Solid-state ¹³C CP/MAS NMR (125 Hz) δ : 181.75 (C=O), 178.67 (C=O), 161.63 (C=O), 154.05, (Ar-C) 141.91 (Ar-C), 133.50 (Ar-C), 130.76 (Ar-C), 120.90 (Ar-C), 107.81 (Ar-C) ppm. Anal. calcd. for (C₃₈H₁₄N₂O₆)_n: C, 76.77; H, 2.37; N, 4.70; O, 16.09%; found: C, 76.25; H, 2.41; N, 4.78%.

Scheme S1. Synthetic method for the synthesis of perylene-based aromatic polyimide (**PI**) through polymerization of a PTCDA unit with 2,6-DAAQ in a single condensation step.

Theoretical capacity calculation:

The theoretical capacity (C_{spec}) of **PI** was calculated based on a three-electron transfer redox process for each formula unit of **PI** using the given equation:

$$C_{spec} = \frac{n X 96485.332 (mAh)}{3.6 X \text{ Mw} (g)} = \frac{26801 (mAh)}{\text{Mw} (g)} = 135.24 \text{ mAh g}^{-1}$$

Where n = 3 and Mw is the molecular weight is about 594.5 g/mole for the single unit of **PI**.
