Section S1: General Information

All chemicals are from commercial sources and were used as received, unless otherwise noted. All reported NMR spectra were recorded on Varian 500 MHz or Varian 600 MHz spectrometers. Chemical shifts (δ ; ppm) for ^1H and ^{13}C NMR spectra were determined with TMS or residual solvent signals as the internal reference. J values are given in Hz. Spectroscopic-grade solvents were used in all fluorescence/absorption-spectroscopy measurements. Mass spectra were obtained with EI ion source and the EBE double focusing geometry mass analyzer or spectrometer equipped with electro-spray ion source with Q-TOF type mass analyzer. The synthesis of compounds **1a-1c**,¹ **2a**,² **2b** and **2c**³ have been described previously.

Absorption and fluorescence spectra were recorded on a Shimadzu UV-3600 spectrometer and an Edinburgh Instruments FLS1000 photoluminescence spectrometer, respectively. Optical densities at the excitation wavelengths for fluorescence measurements were maintained at around 0.1 to avoid reabsorption. Fluorescence lifetimes were measured using a time-correlated single photon counting (TCSPC) technique. Samples were excited at 485 nm by a LDH-P-C-485 laser diode (PicoQuant Germany). The emission was detected by a micro-channel photomultiplier (R3809U-50, Hamamatsu Inc.) coupled with a monochromator. The signals were processed by PicoHarp 300 electronic module (PicoQuant GmbH). The fluorescence decay was collected with a maximum peak count of 10000 counts with a time resolution of 16 ps. Photostability was determined using an Asahi Spectra Max-350 as a light source and a Perkin Elmer Lambda 25 UV/Vis spectrometer.

Section S2: Experimental Procedures

Imidazo[1,2-a]quinoline-4-carbonitrile (**2d**)

A solution of 2-nitrobenzaldehyde (5.00 g, 33.1 mmol), malononitrile (2.40 g, 36.4 mmol) and 2 drops of pyridine were refluxed in methanol (20 mL) for 3 hours. During this time a white precipitate formed in the still hot solution. This solid was filtered and washed with methanol. This solid together with iron power (7.31g, 0.166 mol) was slurried in ethanol (50 mL) and stirred at 45 °C for 30 minutes, then an aqueous solution of FeCl_3 (0.3 g, FeCl_3 dissolved in 6 ml water) was added dropwise. The mixture was then heated to reflux and monitored by TLC (1:1 EtOAc:hexanes). Upon completion of the reaction, the still hot slurry was filtered through celite, and the volatiles removed *in vacuo*. Addition of water to the residue produced an ochre product which was isolated by filtration. This was then recrystallized from THF to yield 2-amino-3-cyanoquinoline (3.9 g, 23.2 mmol, 70%) with spectra consistent to the literature.⁴

2-Amino-3-cyanoquinoline (0.86g, 5.1 mmol) was dissolved in hot ethanol (50 mL), and a 50% solution of chloroacetaldehyde was added (0.65 mL, 10.2 mmol) slowly. Heating was continued for 5 hours at which point the solution was poured into a solution of sat. NaHCO_3 . The product was then extracted into DCM, dried with MgSO_4 , concentrated *in vacuo* and recrystallized from ethyl acetate to yield an off-white powder (0.312g, 1.61 mmol, 32%).

^1H NMR (500 MHz, CDCl_3); 8.14 (d, $J=1.5$ Hz, 1H), 8.03 (s, 1H), 7.98 (d, $J=8.3$ Hz, 1H), 7.91 (td, $J=8.3, 0.7$ Hz, 1H), 7.83 (td, $J=7.6, 1.5$ Hz, 1H), 7.79 (d, $J=1.5$ Hz, 1H), 7.58 (t, $J=7.6$ Hz, 1H). ^{13}C NMR (126 MHz,

CDCl_3 ; 140.5, 133.8, 133.8, 133.6, 132.1, 130.2, 125.8, 121.5, 115.5, 114.9, 112.4, 102.7. ESI-TOF MS (in MeCN) m/z: Calculated for $\text{C}_{12}\text{H}_8\text{N}_3$ 194.0718, found 194.0717.

Benzo[h]benzo[4,5]imidazo[1,2-a]quinoline-8-carbonitrile (**2f**)

(2-Benzimidazolyl)acetonitrile (2.25 g, 14.3 mmol) and 1-bromo-2-naphthaldehyde (3.37 g, 14.3 mmol) were combined in ethanol (50 mL) with 3 drops of piperidine and refluxed for 5 hours. The bright yellow precipitate that formed in this time was filtered from the still warm solution and washed with ethanol then diethyl ether. The solid was then directly suspended in sulfolane (12 mL) and heated to 250 °C until cyclization was complete (monitored by TLC 1:1 EtOAc:hexanes, approximately 2 hours). The brown solution was then cooled to 100 °C at which point it was added to a vigorously stirred solution of water (150 mL) in a dropwise manner. The yellow precipitate which formed was filtered, washed with water, ethanol then diethyl ether to yield the title compound (3.45 g, 11.8 mmol, 82%). Spectral data matches that of this compound prepared through a different procedure.⁵

The resulting residue was recrystallized from an appropriate solvent to yield the desired DPP product.

General procedure A for the synthesis of **4** (using Et₃N)

To a solution of **3** (0.1 g) in dry DCM (10 mL) under argon was added Et₃N (10 eq) with no observable color change. Subsequently, BF₃·OEt₂ was added slowly at room temperature and stirring was continued overnight. The reaction was quenched with water and extracted into DCM. The residue was purified by column chromatography (DCM/MeOH).

General procedure B for the synthesis of **4** (using LiHMDS)

To a solution of **3** (0.1 g) in dry DCM (10 mL) under argon was added a 1.0M THF solution of LiHMDS (1.2 eq) which rapidly darkened the solution. Subsequently, BF₃·OEt₂ was added slowly at room temperature and stirring was continued overnight. The reaction was quenched with water and extracted into DCM. The residue was purified by column chromatography (DCM/MeOH).

Note - Despite many attempts in a range of solvents, the solubility of DPP-BF₂ compounds with large aromatic imidazopyridine substituents at levels required for well resolved ¹³CNMR spectra proved difficult. In these cases some quaternary carbon atoms are not observed.

Section S3: Absorption and Emission Data

Most of emission decays could be fitted successfully to a single exponent accounting for a background due to the instruments dark counts. In some cases a bi-exponential decay model had to be used, but when the second component contribution was less than 5% it was ignored. Other case are marked in the table and discussed separately in the Table S1 footnote field.

^aQuantum yields determined using rhodamine 6g in EtOH. Quantum yields of selected samples were compared to those determined using an integrating sphere and negligible differences were observed.

^b bi-exponential decay **3i** in DMF was observed with dominating 1 ns decay component.

^c the emission intensity was very weak and the lifetime blow the instrument resolution, which is attributed to specific interaction of **3i** with MeOH and strong molecule distortion resulting in the fast quenching of the excited state.

^d bi-exponential decay of **4i** in DMF was observed with dominating 0.8ns decay component.

^e the emission intensity was very weak and the lifetime below the instrument resolution, which is attributed to specific interaction of **4i** with MeOH and strong molecule distortion resulting in the fast quenching of the excited state.

Section S5: Fluorescence Lifetime Measurements

Where two emission maxima were present, fluorescence lifetimes were measured and determined for both but in all cases only a negligible difference could be observed. Only the data recorded for the most intense emission maxima are presented here.

Section S6: X-Ray Analysis

Crystals of **3d** are very thin, easy to bend, dark red coloured plates. Crystals were grown through slow evaporation of a DCM/MeOH solution containing **3d**. A suitable sample was measured on a Bruker D8 Venture single crystal diffractometer. Data were processed with help of Bruker software⁶ and refined using the SHELX software package.^{7,8} CCDC 1983938 contains the supplementary crystallographic data for this paper. The data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/structures. The compound crystallizes in the monoclinic system *P*2/c with two molecules in the asymmetric unit. Views along each of the crystallographic axes can be seen in Figure S34.

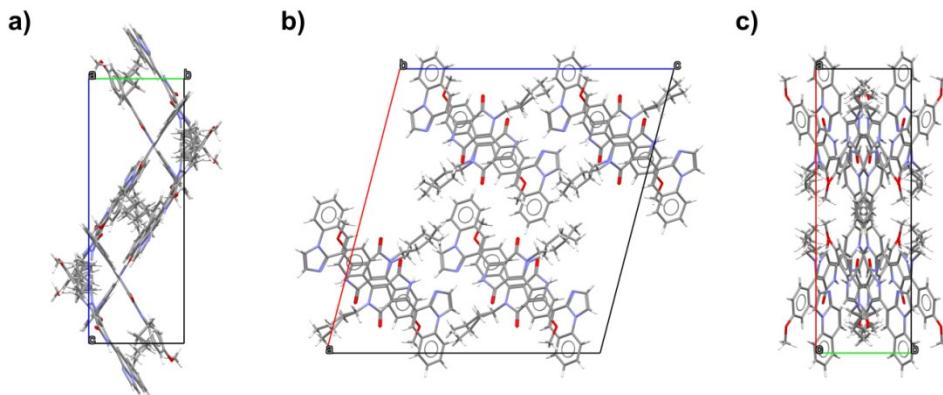

Figure S34. Views along the crystallographic *a* (a), *b* (b) and *c* (c) axes of **3d**.

In the asymmetric unit cell two molecules (denoted as A and B) of **3d** are present. Both of these species contain *n*butyl chains disordered over two alternative sites. In the molecule A, the alkyl substituted pyrrole skeleton also seems to be disordered. Both molecules A and B have similar geometry, however, slightly different orientations of the planar substituents around the diketopyrrolopyrrole (DPP) unit are observed. Indeed the angle between the LSQ mean planes⁹ fitted to all heavy atoms in the DPP core, imidazo[1,5*a*]quinoline and *p*methoxyphenyl moieties are equal to 1.2°, 7.0° and 5.9°, 18.7° for the molecule A and B respectively. In the crystal lattice the molecules are arranged in ...ABAB... columns in the [010] direction. In these columns the shortest distances between DPP LSQ plane of molecule B and atoms in neighbouring molecules A yields 3.38 Å and 3.45 Å which is presented in Figure S35. The arrangement of the molecules in stacks is responsible for the elongated shape of the crystals in one direction.

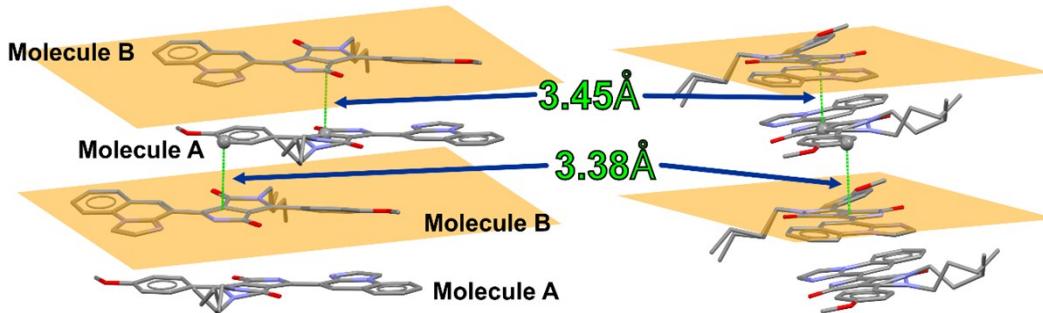

Figure S35. Stacking of molecules in the crystal structure of **3d**.

Section S7: Theoretical Methods

To model the ground and excited state properties of the compounds, we use a protocol based on Time-Dependent Density Functional Theory (TD-DFT) level to determine the transition energies as well as the geometries and vibrations of all states, whereas the environmental effects are accounted for using the well-known Polarizable Continuum Model (PCM). This protocol has been described and tested elsewhere.¹⁰ In all compounds the butyl chains on the DPP core are replaced by methyl groups during the calculations for decreased computational effort. No other simplification is made. All (TD-)DFT calculations are made with the Gaussian16.A03 program.¹¹ During these calculations, we use tightened self-consistent field (10^{-10} a.u.) and geometry optimization (10^{-5} a.u.) convergence thresholds, and a large DFT integration grid (so-called *ultrafine* grid, a pruned 99,590 grid). The DFT and TD-DFT calculations are performed with the M06-2X *meta-GGA* hybrid functional.¹² Given that the excited-states are not of cyanine nature, as in (isolated) BODIPYs, we have not applied post-Hartree-Fock corrections here.¹³ Following a published protocol,¹⁰ the 6-31+G(d) atomic basis set is used for geometries and vibrations whereas 6-311+G(2d,p) is used for the transition energies. The nature of the ground-state and excited-state stationary points is systematically confirmed by analytical Hessian calculations. The impact of the environment is taken into account at all DFT and TD-DFT steps by using the PCM model.¹⁴ For both absorption and emission the LR+cLR¹⁵ model in its *non-equilibrium* limit is applied. This model allows the recovery of both linear-response and state-specific solvent effects and is thus well suited for the bright transitions with a significant CT character as investigated here.

Table S2 displays additional theoretical results including computed vertical absorption and emission wavelengths as well as adiabatic energies and difference of zero-point vibrational energies between the ground and excited states.

Section S8: Photostability measurements

Photostability was determined through the variation in absorption of each sample at the appropriate absorption maximum wavelength (λ_{abs}) with respect to irradiation time. Methanol was selected as the solvent in all cases as this is closest solvent to aqueous media (important for biological imaging) that these compounds are soluble in. Concentrations giving similar optical densities ($A \approx 1$) were used. Quartz cuvettes of samples were irradiated with a 300 W Xe lamp (Asahi spectra, MAX-350) equipped with a UV/vis mirror module through a glass fiber. The absorption spectra were measured at appropriate times during the irradiation. BODIPY (Difluoro{2-[1-(3,5-dimethyl-2H-pyrrol-2-ylidene-N)ethyl]-3,5-dimethyl-1H-pyrrolato-*N*}boron) and DPP (2,5-dibutyl-3,6-bis(3,5-dimethoxyphenyl)pyrrolo[3,4-*c*]pyrrole-1,4(2H,5H)-dione) were used as references.
